management of complex retail operations. Today, retailers are transforming their IT capabilities for many reasons, such as to augment the company's capability to respond to the evolving marketplace via greater speed and flexibility, to collect and analyse customer data while enhancing segregation and to work more effectively, as retailers require a single system operating across stores (or even across countries) to make the most effective use of inventory and enhance business processes.

Emerging technologies such as augmented reality (AR), near field communication (NFC), smart shopping devices and SixthSense are making way for novel and highly interactive customer touch points. These technologies are developing at a rapid speed and throwing complex challenges at retailers. While some touch points have been adopted, many are still in beta stage.

Application of NFC technology in the retail sector

NFC technology is now accessible on most smartphones. Also, cheap NFC tags can be simply added to any physical object to turn it into an interactive experience. For example, Adidas Canada used the technology before opening its Originals store in Vancouver. Followers of the brand's adidasCA Twitter account were invited to a covert location to get an NFC-enabled Hype

Key Card on first-come, first-serve basis and sign up for the chance to win a limited-edition pair of shoes.

When the store opened its shutters, Hype Key Card holders were invited to tap their cards at the counter to check if they had been lucky enough to bag any prize. Hence, the creative campaign not only attracted customers into the outlet, it also created a social media buzz about its opening and improved customer engagement.

Today, brick-and-mortar stores are in cut-throat competition with online stores. This makes physical customer engagement critical for offline stores. In 2016, a Timberland store in New York gave its customers an NFC-enabled tablet to scan tagged products to view product information and recommendations. At the end of the shopping experience, they could then send themselves a dream-list of products they loved by email.

NFC technology is also a key motivating force behind the quick rise in digital wallet payments such as Google Pay and Apple Pay. Mobile payments are fast, simple and handier. Moreover, the fact that NFC payments do not need biometric features, such as fingerprint scans, makes them even more secure vis-a-vis chip and PIN.

Faster payments mean shorter queues at the billing section, so employees have more time for store operations and customer service.

INSULATION TESTERS

Analog

MC-900BA Series

Model	Range	Test Voltage DC
MC901BA	0 - 20 M Ohms	100 V
MC903BA	0 - 100 M Ohms	500 V
MC904BA	0 - 500 M Ohms	500 V
MC941BA	0 - 1000 M Ohms	500 V
MC906BA	0 - 200 M Ohms	1000 V
MC907BA	0 - 500 M Ohms	1000 V
MC981BA	0 - 2000 M Ohms	1000 V

Digital

DIT 99 Series

Model	Range	Test Voltage DC	Resolution
DIT 99A	0 - 20 M Ohms	100 V	0.01 M Ohms
DIT 99B	0 - 200 M Ohms	250 V	0.1 M Ohms
DIT 99C	0 - 200 M Ohms	500 V	0.1 M Ohms
DIT 99D	0 - 200 M Ohms	1000 V	0.1 M Ohms
DIT 99E	0 - 2000 M Ohms	1000 V	1 M Ohms

5KV

DIT 954

Specification	Test Voltage	Range
Insulation Resistance	1000V / 2500V / 5000V	0.1MΩ to 200GΩ
AC Voltage Measurement	0 - 600VAC (50 - 60Hz)	-
Phase Sequence Test	100V - 450V (Phase - Phase) 40 - 60Hz	-
