

## The Art Of Creating 3D Animations

As augmented reality (AR) continues to develop and achieve new technological advancements, you can expect to see more of it in the communication industry. AR has a strong use-case for communication and is bringing about immersive ways to connect people

**A**ugmented reality (AR) has brought about a paradigm shift in the mode of communication and medium of expression. Among other things, AR is turning out to be an extremely riveting tool in communication that bridges virtual reality (VR) and the real world. It is the process of layering virtual elements over the real-life environment. There are many different cases where AR is making communication for individuals much more immersive.

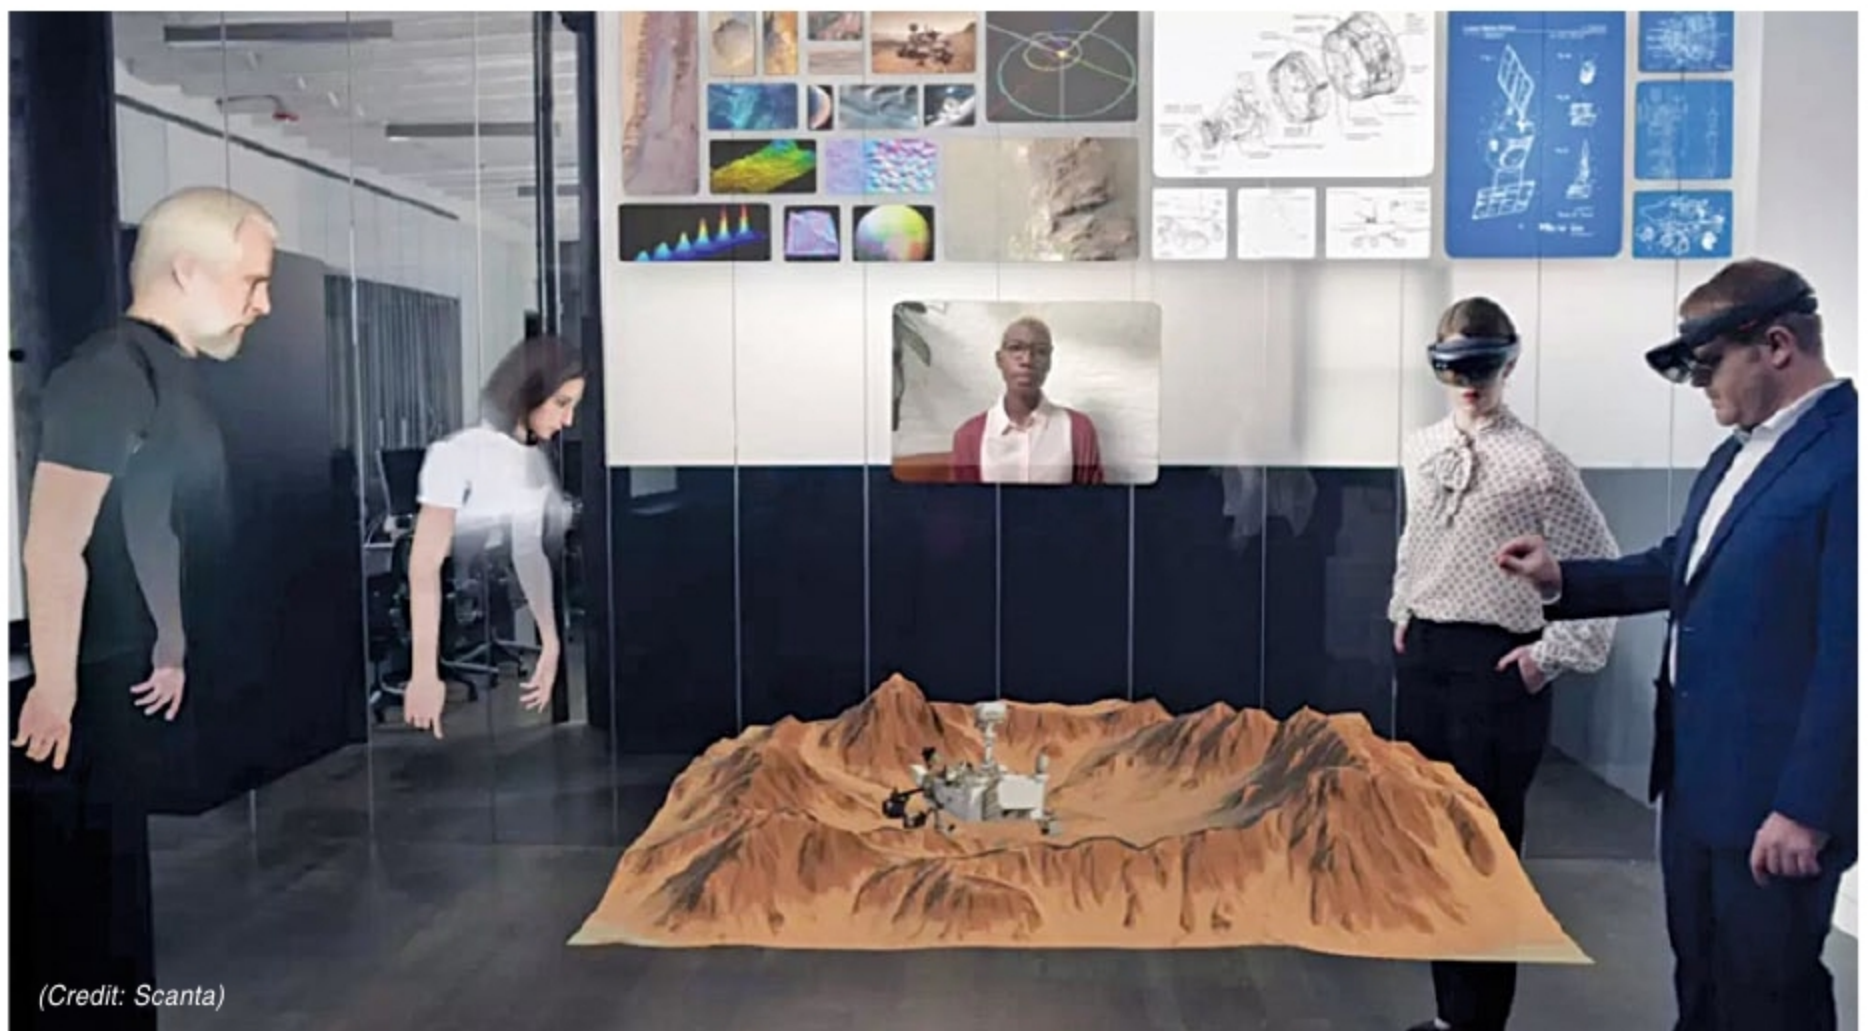

At companies like Scanta, 3D avatars are being used to understand and react to voice commands on a real-time basis using machine learning. Artificial intelligence

(AI), which has machine learning as its backbone, can identify emotions of a user based on spoken words and deliver the 3D *avatar* that mimics the same emotions along with body movements.

### What entails 3D animation

3D animation is the process of creating moving pictures in a digital environment that is three dimensional. Through careful manipulation of objects (3D models) within 3D software, picture sequences can be exported, which give the illusion of movement (animation) based on how objects are manipulated.

3D animation process is a system where
