

TEST & MEASUREMENT

Digital lux meter

Metrix+ digital lux meter LX 1330A+ features a wide measuring range and high resolution. It has an integrated light sensor with 360-degree rotatable head for flexibility at different optimum positions in both lux and foot candle (FC) parameters. Basic features of low battery indication, auto zero adjustment and a clear backlit LCD display give exact readings with no guessing or error. Maximum and minimum value hold function enables getting maximum or minimum values while measuring over a period, while data hold enables freezing the measured value for reporting and inspection purposes.

Cybersecurity test portfolio

Keysight offers a broad portfolio of solutions to help prevent vehicles from being cyber-hijacked, including:

- Automotive Cybersecurity Program to validate and exploit potential attack surfaces existing in connected vehicles
- Automotive Gateway Security Test to validate the zoning and security posture of in-vehicle networks
- Network Security Test to validate and stress a network infrastructure and backend data centres
- Application & Threat Intelligence (ATI) Research Center to ensure testing that includes the latest application and security strike simulation
- Visibility for Network Security to improve performance of a security architecture with hundred per cent visibility of all traffic on an automotive network

Mobile device test platform

ME7834NR is the test platform for 3GPP-based Protocol Conformance Tests (PCT) and Carrier Acceptance Testing (CAT) of mobile devices incorporating

multiple radio access technologies (RAT). It supports 5G New Radio (NR) technology in both standalone and non-standalone modes.

5G NR mobile device test platform ME7834NR provides a smooth transition to 5G while continuing to support LTE, LTE-Advanced (LTE-A), LTE-A Pro and legacy W-CDMA technologies. This enables existing customers to upgrade to 5G while capitalising on LTE-A test environment and staying abreast of the latest technology evolution.

MISCELLANEOUS

Code and execution protection toolset

STMicroelectronics has launched STM32Trust to guide designers' efforts to build strong cyber-protection into new Internet of Things (IoT) devices leveraging industry best practices. STM32Trust combines knowledge, design tools and ready-to-use original ST software. These help designers take advantage of features built into STM32 microcontrollers (MCUs) to ensure trust among devices, prevent unauthorised access and resist side-channel attacks. All this averts data theft and code modification. Integrating all available cyber-protection resources for STM32 family, STM32Trust helps designers implement a robust multi-level strategy leveraging security-focused chip features and software packages.

IR bullet camera

Key features of SATATYA MIBR20FL60CWP bullet camera by Matrix Comsec are:

- Dark Observer Sony STARVIS series sensor
- Crystal-clear night vision; colour images even at 0.08lux
- High-efficiency video coding: H.265 compression technology
- Vision adaptive: true WDR 120db

- 56-degree horizontal field-of-view
- Adaptive streaming

- Records more frames during motion, fewer during no motion
- Analytics includes intrusion, motion detection, no motion, trip wire
- Certifications: BIS, IP66 CE, FCC, IK10
- Parking management and other outdoor applications

Robotics system learning kit

Texas Instruments has introduced the newest addition to TI robotics system learning kit (TI-RSLK) family, TI-RSLK MAX, a low-cost robotics kit and curriculum that is simple to build, code and test. Designed for the university classroom, the solderless assembly allows students to have their own fully-functioning embedded system built in under fifteen minutes. The kit includes SimpleLink MSP432P401R microcontroller (MCU) LaunchPad development kit, easy-to-connect sensors and a versatile chassis board that turns the robot into a mobile

learning platform. Through accompanying core and supplemental curriculum, students learn how to integrate their hardware and software knowledge to build and test a system.

For advanced learning, wireless communication and the Internet of Things (IoT) capabilities can be added to TI-RSLK MAX to remotely control the robot or even establish robot-to-robot communication.
