A feedback-based English language skills improvement program by Pearson

Pearson India has announced the launch of an adaptive English language improvement programme—called Pearson MePro—to aid learners enhance their English language proficiency. Based on Global Scale of English (GSE), the new-age comprehensive English language training programme will provide content and assessment for learning and development of English language skills including speaking, listening, reading, writing, vocabulary and grammar. The online programme will further help in developing accuracy and communication ability, which is essential for studying abroad and desired career growth through better employment opportunities.

App that helps farmers crowdsource water during India's water crisis

Experts estimate that by 2040, 21 Indian cities will run out of groundwater entirely and forty per cent of the Indian population will have no access to drinking water. MyWell smartphone app is enabling Indian farmers to monitor and manage scarce groundwater in a distributed and localised way to monitor water levels in wells that supply drinking and irrigation water. The app is part of a project led by Western Sydney University and funded by Australian Centre for International Agricultural

Research (ACIAR) through MARVI project (Managing Aquifer Recharge and Sustaining Groundwater Use through Village-level Intervention).

Smartphone app that can hear ear infections in children

Researchers at University of Washington have created a smartphone app that can detect fluid behind the eardrum by simply using a piece of paper and a smartphone's microphone and speaker. The smartphone makes a series of soft audible chirps into the ear through a small paper funnel and, depending on the way the chirps are reflected to the phone, the app determines the likelihood of fluid present with a probability of detection of 85 per cent. This is on par with current methods used by specialists to detect fluid in the middle ear, which involve specialised tools that use acoustics or a puff of air.

Relaxation app to manage migraine

Developed in part by researchers at NYU School of Medicine, the app called RELAXaHEAD guides patients through progressive muscle relaxation, or PMR. In this form of behavioural therapy, patients alternately relax and tense different muscle groups to reduce stress. This study is the first to evaluate the clinical effectiveness of an app for treating migraine, and adding an app to standard therapies (such as oral medications) under the supervision of a doctor.
