As the TV is becoming thinner, the space for a powerful sound system is also reducing. Although, sound quality has improved with advancements in sound technology, a soundbar is a great option if you are looking for a cinematic experience from the comfort of your home. A

soundbar is easy to set up and is usually less expensive than a complete home theatre system.

A soundbar has several speakers, some of which have a separate subwoofer, usually wireless; while others have rear speakers to create a full surround sound system. Different soundbars come with different sound quality based on how these handle various frequencies and how these interact with acoustics in the room. Number of speakers and audio technologies used vary between models and price points.

Earlier TV sets and display units were primarily cathode ray tube (CRT)-based and, hence, the boxes were bigger, facilitating larger speakers with good response. As the technology moved to flat-screen TVs, it left little room for good-quality built-in speakers. Soundbars produce good bass response, eliminating the issue of inherent audio loss from the rear of TVs reflecting off the wall.
