

Ten AI Trends Revolutionising Consumer Electronics

The consumer electronics industry is constantly evolving and growing at a fast pace. It has seen a number of new products and developments in recent years, which has led to aggressive investment and innovation. Presented in this article is a roundup of the latest AI trends in the consumer electronics industry

What if your electrical home appliances become live—hear you, see you, feel your emotions and become more interactive? Some of these features have already been made available in artificial intelligence (AI)-based smart home appliances. Interactive and emotional toys, smart fridges, smart thermostats, voice assistants and others are now found in many homes.

Created by a Japanese company, mui is an interactive wood panel that serves as a smart home control hub.

There is no doubt that AI technology is already making a huge impact on our daily lives.

We have seen the capabilities and applications of AI in the manufacturing industry, in oceans and even in

the air. Now, AI is gaining importance in consumer electronics as well. Traditional user interfaces in consumer devices are being replaced with abstract user-interfaces such as voice-based and gesture-based. This emerging technology has created not only many new jobs but has also changed consumer behaviour across the globe. Some experts say that instead of using cellphones, smart entertainment devices and smart home electrical appliances could be used more often with intelligent voice control in the future. While there are many ways that AI is changing our world, let us explore ten trends that are worth mentioning and that are revolutionising current consumer electronics.

1. Smart homes. The complete automated home is a new concept, but slowly the world is moving towards its true realisation. The Internet of

Things (IoT) and AI are being integrated into many household products. Such AI-powered capabilities ensure convenience, comfort and affordability for users. In a smart home, intelligent devices can automatically get switched off or on, and be monitored in real time using smartphones.

2. Smart TVs. Internet-connected TVs have become a lot more smarter with AI technology. As per a recent report, the global smart TV market accounted for US\$ 158.4 billion in 2018, and this number is expected to increase further in the years to come.

Next-generation intelligent smart TVs can connect to the Internet wirelessly, and access online streaming services.

AI-powered TVs can suggest movies, TV shows and Web series based on viewing habits of the customers. These have enabled brows-
