

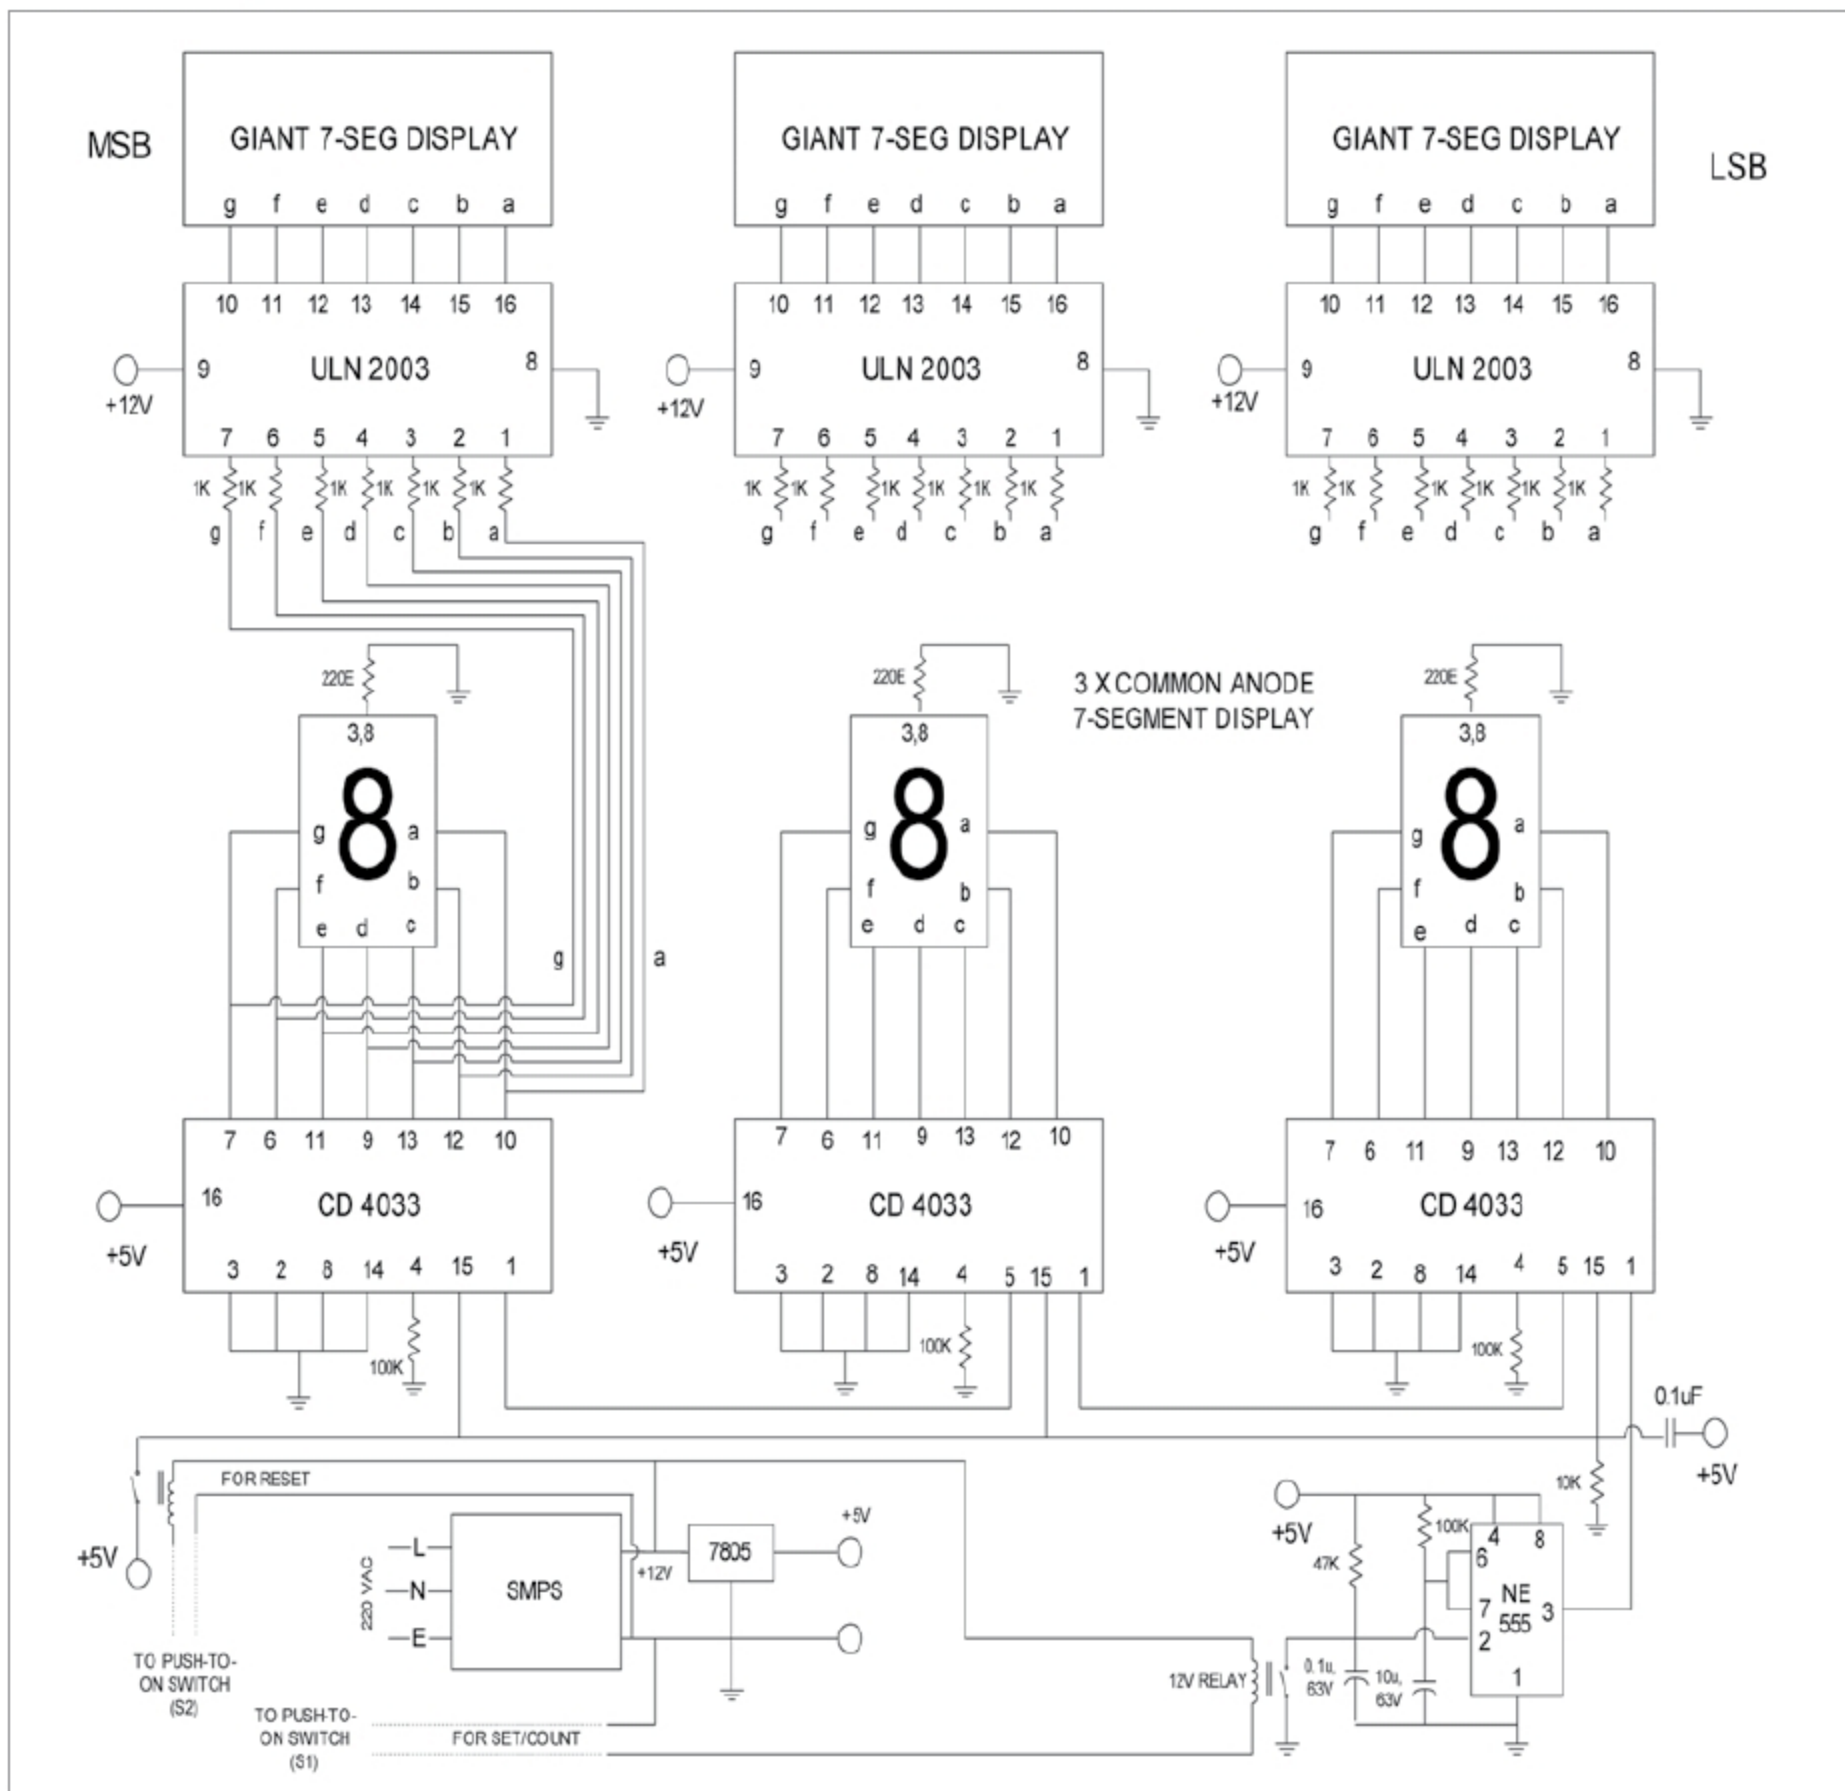

Fig. 6: Circuit diagram of three-digit digital wheel counter

binds all workstations at the wheel forge section in a single thread, and has improved coordination among these, which has maximised production and minimised wastage of time.

- It helps in changing the mindset, improving work culture and shop productivity.
- The displayed wheel production figure can be referred by everyone working in the chain of the line production system at the wheel forge section.
- The displayed wheel production figure is visible through CCTV from various locations of the plant.

- The tool helps central agencies like plant control, higher management, etc for monitoring total wheel production.
- Display of instant production at a section like wheel forge helps convert ninety-plus forging/rolling shift output figures to hundred-plus.
- It helps in better utilisation of available time.
- It has instilled healthy completion among shifts to reach day targets.
- It helps in the flow of real-time production data at all times, to different levels of plant management.

- The display system provides a better means of communication and works as a score board of performance.
- Envisaged direct financial benefit. As Durgapur Steel Plant produces different types of wheels with different weights—for simplification, let us consider average weight of a wheel to be 500kg. Then, only a single-wheel extra production/shift at this stage of the wheel manufacturing process gives a financial impact of around sixty million rupees annually.
- Actual increase in revenue generation is expected to be manifold, as
