

Technology Trends Transforming Media And Entertainment Industry

With consumers increasingly becoming multi-device, multi-platform users, brands must know exactly where their target audience spends their time and why. New channels and devices are becoming central to the entertainment habits of consumers, but traditional channels like broadcast TVs still play a crucial role in an effective end-to-end marketing strategy

Content is a major role player in the media industry in every aspect, from concept development and licensing to figuring out how people consume their favourite music and videos, and so on. Advancements in cellphones, cameras, rendering software, computing processors, smart TVs, earphones/headphones, advanced sound systems and wireless have transformed the media and entertainment industry by enabling the building and transmission of great

content. Artificial intelligence (AI), augmented reality and virtual reality (AR and VR), blockchain and other such technologies have further helped improve content delivery, leading to an explosion in the growth of streaming services.

High-speed Internet, falling costs of content creation and ease of reaching out have changed the way of interaction between content creators and consumers. Streaming has become the primary revenue driver for both music and video, altering how the industry and artists deliver media to fans. This has led to a shift in consumer behav-

iour and technological advancements with rising importance of data and its ability to alter creation and delivery of all media types.

Evolved audience engagement

Over-the-top (OTT) content is audio, video and other media delivered over the Internet without the involvement of intermediaries. OTT platforms continue to flourish as advertising and subscription-driven revenue models for branding and marketing of products. Creators can now determine how their content is being used, sold and distributed specifying details of Intel-
