

Let the Hardware Do the Hard Work

Advanced Noise Filtering with the ATmega4809 Family of Microcontrollers

Microchip's megaAVR® microcontrollers (MCUs) extend the capability of real-time control systems by combining intelligent hardware peripherals with the low-power performance of the AVR® core. As the first megaAVR device to include Core Independent Peripherals (CIPs), the ATmega4809 can execute tasks in hardware instead of through software. The processing power of the integrated high-speed Analog-to-Digital Converter (ADC) enables faster conversion of analog signals, resulting in faster, more deterministic system responses and better noise immunity. These features make the ATmega4809 family an ideal companion MCU in complex microprocessor-based systems, or an excellent standalone processor in command-and-control system designs.

Key Features

- 8-bit AVR CPU core with hardware multiplier
- Up to 48 KB of Flash memory
- Up to 16-channel high-speed 10-bit ADC
- Configurable custom logic
- 6-channel peripheral event system
