

Field device connectors

Phoenix Contact has introduced PLUSCON IP20+ connectors for signal, data and power applications in industries, which demand connections to be water- and dust-proof. The series

covers up to 65-pin signal connector, up to 150A power connector and data connectors for all bus systems like Ethernet, PROFINET, INTERBUS, PROFIBUS, DeviceNet and CANopen.

TOOLS & EQUIPMENT

Unified communication servers

Matrix has launched a range of unified communication servers for large and mid-level enterprises, mid-market companies, small and medium businesses, and government organisations.

Named 'SARVAM', the range consists of hardware platforms and

software server. With IP at core, unified communication servers offer connectivity for up to 3000 users. Three different variants are available: Eternity Lenx, Eternity Menx and Eternity Genx targeting large, medium and growing enterprises, respectively. The platforms support VoIP, GSM/3G, and traditional networks such as ISDN and PSTN.

AC induction motor controller

Roboteq, Inc has introduced a dual-channel variable-frequency drive

capable of simultaneously driving two AC induction motors. Each motor can draw up to 60A at up to 60V, or 3.6kW per channel. The FIM2360 supports multiple advanced operating modes, including scalar open-loop volts per Hertz, fixed slip control or field-oriented control torque/speed modes. It is suited for use in automatic guided vehicles, warehouse automation robots, police/military robots, personnel carriers, golf cars, materials handling equipment, electric boats, automated guided vehicles, agricultural robots or any other high-power, battery-operated applications.

MISCELLANEOUS

Intelligent network interface controller

The newest MOST150 intelligent network interface controller (INIC) from Microchip Technology enables automotive manufacturers and tier-one suppliers to incorporate Media Oriented Systems Transport (MOST) networks in a daisy-chain configuration on coaxial physical layer with the support of full-duplex communication, in addition to a ring topology. With a full-duplex daisy-chained network, a single cable segment is sufficient to connect two adjacent devices in the

network, reducing cables and connectors for the back channel on each network connection. It also eliminates the return wire connecting the last

node of the network to the first. This reduces wiring and component count.

New MCU software

Texas Instruments (TI) has introduced DesignDRIVE Fast Current Loop software that makes C2000 microcontrollers push current-loop performance to less than one microsecond. Together, TI's C2000 MCU portfolio and DesignDRIVE software deliver system-on-chip functionality, which simplifies drive control system development. The software simplifies designs by eliminating the field-programmable gate array (FPGA) typically used for external current-loop control. Fast Current Loop software is a free update available for C2000 controlSUITE software.

Transmitter/receiver evaluation boards

ROHM has announced USB Power Delivery (USBPD) compatible transmitter/receiver evaluation boards that connect to information and peripheral devices using the new 'Type-C connector.'

USBPD extends the power supply range from the conventional 15W to up to 100W (20V/5A) between USB Type-C compliant devices. This enables larger devices such as laptops and TVs to be powered via USB.

The new BM92AxxMWV-EVK-01 series integrates ROHM's USBPD controller IC that supports the USB Type-C Rev1.1 and USBPD Rev2.0 standards for connecting with USB Type-C devices. The initial launch consists of six boards in a mix of both receiver and transmitter types to meet the needs of a variety of applications. Users can combine receiver and transmitter boards to easily achieve and evaluate USB PD operation.
