porary world, where 'progress' is defined by constant growth driven by large manufacturing facilities, the stress on natural resources is pushing our planet towards destruction. Therefore, we need to think differently, both socially and economically.

Some of the key agents of environmental destruction are the various forms of waste -- industrial, natural, chemical, etc. It's now critical that we create platforms that enable waste to be converted and reused for the betterment of society, rather than let-

ting it either accumulate in landfills, slowly poisoning the soil; or ruining the air we breathe by emitting hazardous greenhouse gases.

Green or clean technology investments mean backing or funding organisations that have sustainable and environment-friendly products and services. There are some strong industries that are emerging in this domain like water and waste management, green energy, the organic agri business, green mobility, and the energy efficiency domain.

Even if, globally, green investments fell in 2016, consolidation in the previous years made the overall category grow in terms of capacity installation from 127.5GW in 2015 to 138.5GW in 2016. Combined renewable sources were responsible for 55.3 per cent of all new power generated worldwide. These are some very strong indicators of how the investor community and business evangelists view this sector.

Still Using Battery? Switch to Ultracapacitors!

Ultracapacitors are capable of storing and discharging energy very quickly and effectively.

Available from 2.5V to 160V
