FROM WORKPLACE TO GARDEN

JANANI GOPALAKRISHNAN VIKRAM

Measuring just 7.5x2.7x2.1cm³, this USB flash drive can store up to 2TB

Store up to 2TB in a flash drive

The world was surprised when thumb drives came with capacities greater than a gigabyte. What would you say now that Kingston has come out with terabyte-capacity USB flash drives?

Kingston's DataTraveler Ultimate GT comes in 1TB and 2TB capacities, each priced at around a thousand dollars. If you need to backup large production files on the go or take along a 4K or 8K RAW video footage, it is definitely worth investing in.

USB 3.1 Gen 1 improves the performance by up to ten times while also providing better power management. This makes DataTraveler much faster than traditional external hard drives. A small footprint of 7.5 x 2.7 x 2.1cm³ and protective zinc alloy metal casing make the device handy and robust to carry along. Although made for USB Type-C ports, these flash drives also work with the USB 2.0 and 3.0 Type-A ports commonly found on PCs, tablets and other devices.

The high-capacity flash drive is ideal to use with Android devices that support USB OTG (On-The-Go). So users can quickly access, edit and transfer files without any performance lag. Apart from regular versions available for sale, the company provides the option to customise drives for orders greater than 100 units. You can design the casing, logo and other aspects, or pre-store some content on the drives.

Unified threat management at work, at home

With an increase in the number of connected devices (the Internet of Things or IoT), users are under constant threat from cyber criminals even at home. From identity theft to break-ins, a lot of mishaps can arise out of loopholes in your home network's cyber security.

Fortress Cyber Security offers a way out with its home-focused, enterprise-grade unified threat management (UTM) solution. This software stack and hardware solution allows users to deploy several enterprise security technologies at home. It monitors every connection on your home network, detects and prevents intrusions, and blocks bad connections, viruses and ransomware. Fortress maintains a blacklist of cyber security threats and bad actors (or bad apples) on the Internet. This information is distributed to every device on your network. What is interesting about Fortress' claim is that even if a bad actor manages to get in, he cannot get out of your network.

Connected whiteboard that saves your work

If you believe that jotting down ideas infuses much more creativity and focus than digitally representing them, **Quirklogic's Quilla** is for you. Positioned as a replacement for whiteboards, Quilla is a combination of a 106cm (42-inch) E-Ink electronic paper display (EPD) and electronic ink technologies, which can be used like a whiteboard and marker! Despite its large size, the Wi-Fi connected device is lightweight enough to carry it around your office. Quilla is battery-powered, and despite the device being always-on, a single charge lasts up to 16 hours. There is hardly any glare and you can read content even in bright sunlight.

Quilla is very comfortable to use. Simply touch to erase, resize, copy or move content. Your page is not limited by the edges of the device. You can simply span and continue adding content. It is also possible to import images and PDFs to review

Quilla is like a whiteboard that enables real-time collaboration (Courtesy: Quirklogic)

and annotate. Content written on the board is immediately saved in the user's library. This enables both personalisation and collaboration. You can access your content from anywhere and start off where you left. Likewise, you can connect multiple devices from different locations, to share work and collaborate in real time, from anywhere.
