

Laser distance measurer capable of problem solving

Designing a physical space is complex and tedious due to the measurements and calculations involved. You need to get all the dimensional parameters together, calculate the relative placement, find the right design, re-calculate and re-measure to map those design points to the actual physical space. If you have it wrong, it is back to the measurements again.

Plott has come out with a device that can simplify these tasks for you. **Cubit** is their first attempt at a tool that can think and solve problems. Equipped with dual lasers and a smart wheel, it aims to free users from the tedium of making complex measurements and the innumerable calculations needed for layout placement. So you can focus on the goal of the project and plan the journey accordingly. Cubit will do the rest!

Cubit looks like a simple tape measure but it's a smart tool that bridges the gap between design and construction (Courtesy: Plott)

Cubit can measure distances up to 30.5 metres (100 feet), with an accuracy of 2mm. The built-in wheel is used to measure short distances and irregular shapes. The app combines these measurements with photos of the physical space. You can virtually design your project with real-world scale and context, download and incorporate designs from the Web, and share your design with others to collaborate.

When you actually get down to implementing the design in the real world, Cubit guides you to your measurements using directional arrows. A bulls-eye maps the points you created so you just need to walk around with Cubit to figure out where you need to place stuff or perform construction tasks. No more complex calculations and errors! A feedback process correlates the completed place with the original, so you can see how it has changed.

A weeding robot from the maker of Roomba

Franklin Robotics is well-known as the maker of Roomba—the house cleaning robot. Now, they are all set to give you a garden cleaning solution too!

The new robot, called **Tertill**, automatically and constantly weeds your garden. There have been tech solutions for weeding before, but what makes Tertill special is that it works autonomously. It stays in your garden—rain or shine—and charges with solar power. It uses no chemicals, so it is easy to go the organic way with Tertill.

The robot keeps patrolling your garden looking for weeds. Its sensors help it to detect and steer away from plants. Small plants are considered as weeds and pulled out using string trimmers and weed whackers. To prevent Tertill from accidentally pulling out young saplings, you can fit these

Tertill solar-powered robot to weed your garden

with plant collars till they grow to a particular height, when these are out of danger. Armed with special proprietary algorithms, Tertill patrols the garden in such a way that it can find and get rid of maximum weeds in an effective way.

LeGrow™

A non-messy, sure-shot indoor garden for your home or workplace (Courtesy: Winmart Design)

A smart indoor garden that's sure to grow

Adding a green touch to your workplace improves not just the ambience but productivity too. Plants are wonderful to have at home as well. But, not everybody has a green thumb! The **LeGrow Smart Garden** ensures that you have a nice collection of indoor plants that grow well.

At the heart of LeGrow's solution are the modular desk planters. You can click together the planters like Lego blocks and make an interesting indoor garden. The pot is designed with an internal water reservoir, which captures the excess water. This not only avoids spilling and leakage but also retains the moisture, so you do not have to water the plants frequently.

The LeGrow Shine plant growth lamp contains two light-emitting diode (LED) bulbs that turn on or off to provide the right intensity and brightness of light for the plants to grow well. Apart from this, the ecosystem also includes LeGrow Spring air purifier and humidifier that provides the plants with ideal humidity conditions.

The solution comes with a handy power pot with four USB ports, which powers the humidifier, light source and two more of your devices. The Smart Garden is available in different configurations that include different number of modules such as planters, power pot, humidifier and lights. You can pick the option that fits your needs best. The company accepts orders through Kickstarter (<https://www.kickstarter.com/projects/1413554510/legrow-the-smart-indoor-garden-for-any-space?token=414d6b22>).
