

the microcontroller, where calculations take place. The data is calculated in the form of power consumption and currency, and displayed on the mobile application. As wireless connection is established through GSM, the user needs to have a network-enabled SIM card inserted into Betty.

The device runs smoothly on 2G speed, so slow network barely affects its functioning. Sharma shares the reason behind the choice of GSM support over Wi-Fi: "India is improving in its Wi-Fi connectivity, but it is still not in the best condition. Even 3G or 4G is not 100 per cent reliable. In comparison, 2G is ever-pervasive. It is available even outdoors."

Once an on/off schedule is set, the information is stored in the server. Even if the mobile application is not working during the schedule, it will not impact the functioning of Betty. The device also has manual control buttons. Even 6-ampere appliances can be handled using a 6A-16A converter. Monitoring data from Betty is consistently stored on the server. In case mobile Internet is not available on Betty's SIM, the device can locally hold consumption data for up to eight hours, which is displayed to the customer when the network returns.

If security mode is selected in the mobile application, the plug's motion sensors will detect any kind of movement within a 9-metre (30-feet) ra-

dium and instantly trigger an alarm on the user's mobile application.

The application allows user management, i.e., multiple users can have permission to handle the application and functions of Betty. All authorised users will receive notifications at the same time and get access to the data and controls.

Betty, the helper

Electricity is used everywhere, so essentially anyone can use and benefit from Betty. The company eyes small and large business offices, commercial buildings, SMEs as well as home-owners as the target consumers of Betty. The main benefit of Betty and Be-Connected application is lowered electricity bills and secured premises.

Scheduling different appliances on the Be-Connected app

Scheduling helps users to ensure no appliances are running when not in use, saving a lot of energy wastage. Moreover, monitoring helps users understand where they can cut their electricity consumption and also see how much they are saving using Betty. The information through the application enables regular monitoring, planning and better scheduling of electricity consumption. Beyond Evolution claims an average of 12 to 15 per cent electricity cost reduction using Betty.

tion using Betty.

In the market

Betty is already available in the market. It can be purchased from any major online retail site like Amazon, Flipkart, Paytm and Ebay, or from the company's website for ₹ 2499. The plug-n-play device has no installation hassles, the mobile application is user-friendly and self-explanatory, and there is no additional operational cost other than the connection expenses for the SIM inserted in Betty.

Betty is getting positive customer feedbacks—some even reporting up to ₹ 1000 savings on their household electricity bills. The company now plans Wi-Fi inclusion and other upgrades for the device, which will be rolled out soon. **EFY**

What you can do with Betty

1. Automate your appliances or control them remotely with your mobile
2. Know the exact amount of power consumption by the devices in real time. Make informed decision on areas where consumption might be controlled or cut down
3. Be notified when power supply is cut off in your premises and when it resumes. Also, stay updated when Betty is performing any action
4. Insert previous current consumption data and get a regular comparative data on power consumption saved using Betty
5. Perform analytics on available data (daily, weekly or monthly) using Be-Connected mobile application
6. Set multiple schedules on different devices through Be-Connected mobile application
7. Keep your home or office safe, and get alarmed or alarm your neighbour in case of a security breach
