

OpenAPC: The Process Control Software

OpenAPC (short for 'open automatic process control') is an open source SCADA software that finds wide-ranging applications from automating readings and alarms for automation systems to laser engraving. It is a complete package for multi-platform visualisation, process control and human-machine interface (HMI) application.

Components

The automation system consists of several sub-components that specialise in different tasks. From an electronics hardware-cum-software process to mechanical process, OpenAPC provides a wide range of services. Be it automation and control of production lines to CNC and material processing, or job-work of cutting, welding and engraving, this automation software is a boon to users.

OpenAPC consists of ControlRoom, CNConstruct and BeamConstruct tools.

ControlRoom is a process control software to create and run HMIs. Other than controlling machinery and production processes, it also caters to home automation.

CNConstruct is a CAD application used for seamless process control of a project undertaken in WYSIWYG environment.

BeamConstruct is similar to CNConstruct CAD application but serves laser-based operations like welding, cutting, engraving and surface cleaning.

Functions

OpenAPC is a simple but com-

prehensive software package that provides designers with a complete idea of automation systems including CAD-based operation. Thus, it saves their precious time.

OpenAPC supports several lev-

els—from application development to execution. OpenEditor, a component of OpenAPC, allows designers to create applications as per their requirements. It also lets them modify existing projects.
