

The mobile industry is also making use of augmented reality. From smartphones with GPS to wearable technologies, ranging from Google Glass to Apple Watch, this comprehensive application of augmented reality can be expressed with specific apps and micro-location technologies. Already there are many applications that offer the same basic versions of augmented reality techniques.

Other growing applications of augmented reality are in direct training of students in the fields of engineering and medicine, in the military sector where one can get the precise location of the enemy, in works of art, in the teaching sector where it can help enhance the learning material with interactive apps, and so on.

Pokémon Go

Pokémon Go, developed by Niantic for iOS and Android devices, is a popular application of augmented reality. It is a location based augmented reality game, which makes use of the GPS system in your smartphone. You basically use the GPS to locate and capture virtual creatures known as Pokémon, which appear on the screen in the same location as the player.

The game quickly became a global phenomenon across the world and has already been downloaded by more than 100 million users.

Gameplay. After inception of a game account, you, as the player, create an avatar for yourself. The avatar uses the map by using

your real-time location. Moderate features include Pokémon gyms and PokéStops.

PokéStops provide you with items such as Poké balls and eggs, and are equipped with items called lure modules in order to attract wild Pokémon; whereas, gyms serve as battle areas for a team based king.

Gyms and PokéStops are located at real places and within access to you. Different Pokémon are present in different locations of the world.

When seeking a Pokémon, you can appear in a rendered generic background or in augmented reality mode. The latter uses your phone's camera and gyroscope to display the image of the Pokémon in the real world. When you encounter a Pokémon, you have to throw a Poké ball at it.

If you are successful in catching a Pokémon, it will come under your ownership. Success rate of Pokémon capture integrates the type of force, the right time as well as the type of Poké ball.

When a wild Pokémon is captured, you are crowned with in-game currencies (stardust and candies). At the same time, candies are awarded after a successful catch that depends on the evolutionary chain of a Pokémon. You can also use candies or stardust to raise the Pokémon's combat power.

Every single Pokémon evolution tree is surrounded by its own candy, which is important in order to level up. You are free to transfer the Pokémon back to Pokémon professor, who could help

you earn another candy and create extra room for more Pokémon. Combat power of Pokémon is a rough measure of the show of power that a Pokémon will give in battle. Also, Pokémon of similar species possess the same combat power.

You can go up a level in the game by gaining more points. In level five, a Pokémon gym is open for you and you can join any one of the three coloured teams. When you enter a Pokémon gym, the entire battle is controlled by a player who is not part of your team, offering the challenge to lower the prestige of the gym. Consequently, when the prestige is brought down to zero level, you get the control of the gym. Then, you can deposit one Pokémon in order to defend yourself. **EFY**
