ARTICLE FOR EFY

I am a regular reader and fan of EFY for the last decade, presently working in Bahrain Training Institute, Kingdom of Bahrain. I, along with one of my colleagues, am interested in publishing an article in EFY. The article is related to process automation using pneumatics, hydraulics and LabVIEW. We have a state-of-the-art lab with all equipment and components from Festo, Germany.

EFY. Thanks for your interest in EFY! We are glad that you wish to contribute an article to EFY. Please send the complete article/project to editsec@efy.in for review. Before sending the article, you may refer to EFY's editorial guidelines at http://efymag.com/Guidelines_for_EFY_Authors.doc

COMPRESSION USING MATLAB

In 'Lossless Image Compression Using MATLAB' DIY article published in February 2016 issue, what should I do to compress the whole video once I have converted it into frames?

Kailash yadav

Through email

The author Lalit Patil replies:

Write a 'for loop' code to compress frames one by one. When complete compression of frames is done, merge the frames into video to make it a compressed video.

HUMIDITY AND TEMPERATURE MONITORING

In 'Humidity And Temperature Monitoring Using Arduino With The IoT' DIY article published in October 2016 issue, how can I get an alert message in the form of an SMS from ThingsSpeak

From electronicsforu.com

Electronics Projects

In 'Electronic Eye Security System' DIY article published in January issue, the buzzer in the circuit is ringing continuously as soon as the circuit is turned on. Please help.

Omkar

EFY. If you exposed LDR1 sensor to light source, you will get a continuous buzzer alarm. Cover LDR1 completely with a suitable size opaque material or contraption to stop the alarm.

The 'Electronic Thermostat For Fridge' DIY article published in May 2016 issue is a little complicated but you have explained it very well!

Vivek Potdar

EFY. Thanks for the feedback!

when the temperature goes beyond a threshold value?

Aishwarya Kagalkar

Through email

The author Citharthan D. replies:

It is only possible to receive a tweet. For tutorial and examples, please refer to the following link: https://thingspeak.com/pages/how_to_act

If you need to get an SMS or email, try Ubidots. You can get step-by-step information on their website, <https://ubidots.com/>

SMART WI-FI

I got my Smart Wi-Fi module that was (NodeMCU) used in 'Introduction To Smart Wi-Fi' DIY article published in March 2016 issue. After interfacing the module with ESPlorer software, I set the baud rate to 115200 and port as COM3. I clicked on Open, but it is not connecting to the microcontroller. When I press Reset on the module, it shows the message "Your firmware was not auto detected." When I connect the module to the PC and upload Lua script, it shows errors on every line. I

pressed Reset and Flash buttons on the module but nothing happened. Do I need to update firmware? I am a beginner to NodeMCU module. Please help.

Ramji Vadivelu

Through email

The author T. Anand replies:

The default baud rate is 9600. The connection problem is caused by some of the settings in ESPlorer IDE. Uncheck Autodetect Firmware and check on Dumb Mode - Never Check Answers. There are plenty of resources available online for using Lua with NodeMCU firmware and ESP8266. Here is the link for library files on GitHub: <https://github.com/knewron-technologies/smartWIFI>

Readme file is also part of GitHub page: <https://github.com/knewron-technologies/smartWIFI/blob/master/readme.txt>

EARTHQUAKE INDICATOR

The 'Earthquake Indicator Using Arduino' DIY article published in January 2016 issue does not work. Neither the LCD displays anything nor the beeping stops. After compiling the code it shows the following error message: "EarthQuake.ino:2:28: fatal error: EEPROMAnything.h: No such file or directory....compilation terminated. Error compiling."

The library file has been added but still there is an error when the program is compiled.

Vaibhav

Through email

The author Ronie Adhiraj Ghosh replies:

EEPROMAnything.h is a separate library provided with the source code. Before building the circuit you need to go through the text in the article properly. Copy the header file in Arduino library and then compile it again.
