IoT module

Gemalto's LTE Cat M1 IoT module with very low power consumption will expand the use of cellular connections in applications such as security systems, points-of-sale, vending and eHealth solutions. The Cinterion IoT module is compatible with Gemalto's embedded SIM (eSIM). In addition, it supports remote device updates and quality-of-service management over the lifetime of the device. The module enables wake-up times that are 15 times faster than traditional solutions. This preserves power and improves responsiveness, which are essential for power-sensitive, battery-operated IoT applications.

500kVA UPS

Delta Electronics has launched its 500kVA Modulon DPH series uninterruptible power supply (UPS). This online double-conversion UPS is claimed to have the world's highest power density of 55.6kVA per 3U module. Thanks to its modular design, the UPS enables advanced control of power module redundancy as well as the ability to add capacity and pay-as-you-grow scalability.

ID card printers

Digital Factors FZCO has launched DF series card printers (DF150, DF350 and DF350LM) that can handle enterprise-

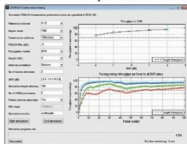

level demands while still being easy-to-use and affordable. These can print up to 220 full-colour, one-sided cards per hour or up to 165 two-sided cards per hour. The modular design allows users to add field-upgradable features and encoding technologies to satisfy their unique printing needs.

5G Library for 3GPP radio

MathWorks has introduced a 5G Library aimed at supporting wireless design exploration in advance of the initial 3GPP 5G standard specification release

in March 2018. The 5G Library provides functions and link-level reference designs that help wireless engineers explore the behaviour and performance of 3GPP new radio technologies. With the 5G Library, wireless engineers can conduct simulations to evaluate 5G enabling technologies and their impact on overall 5G system design.

Ultrasonic PCB cleaner system

LeelaSonic has developed an ultrasonic cleaner for successful cleaning

of through-hole or SMD PCBs. No more hand and mechanical brushing is needed to remove oxides from printed circuits.

Collapse or implode of cavities releases tremendous energy and produces an intense scrubbing action on the PCBs immersed in the liquid. The scrubbing action created by cavitation dislodges particulates matter from the PCB surface. It is literally like having millions of microscopic bombs going off. The concussion of these bombs blasts flux particles loose from the PCB, but without harming its surface.

Video IP desk phone

Matrix has unveiled Sparsh VP710 smart IP deskphone. With a 17.8cm (7-inch) touch adjustable screen, the deskphone is designed to bring seamless video calling experience with a dash of Android experience. It is equipped with full-duplex handsfree HD speaker, HD video

calling, Internet connectivity, multimedia apps, multilingual user interface, caller ID, Android File Manager, e-mail, calendar, camera, gallery, recorder, calculator, browser, message, call management features, voicemail, directory integration, direct dialing and status indication, in line with smartphones, tablets and laptops.
