

Meet MRPT: The C++ Robotic Destination

PRIYA RAVINDRAN

You wake up in the morning and your cup of hot, steaming coffee is brought right up to your bed. Breakfast is just the way you like it, the house is clean and your car is ready for you. Your 24/7 staff at the office is all charged up and working at a pace you can only begin to comprehend. Everything is in its right place, your schedule fixed and presentations complete. Sounds like your personal assistant is too good to be true! Right?

But what if this is not a scene out of the page of the life of the businessman on the cover of *Forbes*? What if all you need to do

is put together some hardware, play around with a few lines of code and lo behold, you have someone who can do anything you ask it to do?

Specs at a glance

Software	: Mobile Robot Programming Toolkit
Developer	: The MAPIR group, Jose Luis Blanco
Stable release	: MRPT 1.3.2
Written in	: C++
Operating system	: Linux, Windows
Type	: Robotics Suite
Licence	: New BSD licence
Website	: www.mrpt.org

Oh yes, we are talking about the robot you have always dreamt of!

This article discusses Mobile Robot Programming Toolkit (MRPT), a cross-platform and open source C++ library designed to help you program your dream robotics application. Earlier distributed under GPL licence, versions 1.0 and above now come under the new BSD licence. MRPT is based on OpenMORA, the Open Mobile Robot Architecture for mobile robots.

Portable, well-tested applications and libraries come as part of MRPT package, which covers data structures and algorithms employed
