

Yet another example is from Australia-based Infoxchange, a non-profit enterprise which has integrated Google Map systems to create the Ask Izzy mobile application. Census reports suggest that one in every 200 citizens of Australia is homeless, while 80 per cent of them own smartphones. The application locates the nearby vital service available, including food, shelter, employment opportunities, legal and financial help, Wi-Fi, charging stations and so on. Presently, over 350,000 services are listed on the map, while 500 users login to the application daily.

Enterprises engaged in development or corporate social responsibility work can use Google Maps innovatively to make their initiatives effective as well as efficient with minimal costs.

Visualisation and monitoring to increase revenue

Organisations need to properly visualise business challenges in resource and material movement, etc. This helps them devise better strategies to improve their services and avoid losses.

Google Maps provided a data visualisation solution to India-based Madras Cements, which wanted to leverage the data through interactive graphics generated by the Ramco ERP system. The service resulted in up to 70 per cent cut in losses and penalties, 40 per cent faster consignment clearance, and 20 to 30 per cent market share.

Airberlin made an example of its own by integrating Google Maps API in its web-based application to provide users an informative interface on flight routes and other details, weather conditions and flight bookings. The implementation saw 40 per cent increase in booking via map interface and 50 per cent increase in website traffic.

Local tracking services

Be it parcel delivery or local cab tracking, this feature is the most widely used by enterprises. Popular applications like Gobasket and Swiggy use Google Maps APIs to receive customer orders, calculate availability, distance and cost, and allow customers to track delivery. Cab services like Grab and GoOpti use the scalability and advantages of Google Maps to provide satisfying experience to their customers and easy work for their drivers. All over the globe, there are many such enterprises that utilise Google Maps for local tracking services.

To sum up

These instances show how different offerings from Google Maps can be customised to the needs of organisations. Enterprises can leverage the intelligence provided by Google Maps services to effectively streamline their expenses management while multiplying their profits through up-graded business strategies. **EFY**

recruiter and the job seeker. So one of the leading staffing agencies in India approached Bengaluru-based artificial intelligence firm EdGE Networks for a solution to create a large comprehensive database of resumes and find the right profiles for its clients. EdGE Networks suggested the use of its artificial intelligence (AI) solution HIRE-Alchemy, which included natural language processing, AI and predictive analytics. The outcome was outstanding.

When the consultancy implemented the AI solution in its recruitment system of updating resumes from e-mails, job portals, etc, it recorded a 500 per cent increase in its resume matching capabilities. In the process, it also managed to register a whopping 2000 per cent increase in its database size.

Artificial intelligence is increasingly being recognised as an inevitable concept the world over. And while it is creating waves across industries, the human resources (HR) industry has silently started using it for substantial gains. And deep learning plays a pivotal role in it.

"We are testing the waters before AI implementation. Globally, it may have taken off in a big way but India will follow suit soon,"

Deep Learning For Deeper Employee Engagement

► Tools like voice analysers and text analysers help decode an employee's communication to the management.

For a recruitment consultancy, the biggest task is finding the right match to both the
