

FEEDBACK

YOUR SUGGESTIONS

THANKS!

I found the latest issue of EFY on my desk. I just read it and found myself unaware of several technological developments. So kudos to your team as you are doing your job exceedingly well!

I would ask myself why two magazines EFY and EB from the same stable and apparently for the same audience, but then I realised EFY is primarily focused on its core audience—engineers, geeks, developers and decision makers in the technical sphere, whereas EB is consolidating foothold in commercial decision making.

Last but not the least, I was really impressed with Binay's 12W LED tubelight with lumens output equivalent to an 18W standard tubelight's!

Ajay K. Gugnani

EFY. Your email made our day! We are happy that you found the recent issue informative, and that through the letter you have explained to our esteemed readers the difference between EFY and EB. Thanks for the good wishes!

GREEN MOBILITY

The article 'Green Mobility' published in June issue is very interesting and covers at great length developments in all the countries. The heart of an electric vehicle (EV) is an electric engine. Electric engines are brushless DC (or BLDC) motors with high-energy rare earth magnets powered by Li-ion batteries. Compared to industrial motors' 2kW per kg, the recent advances allow BLDC motors to output 5kW per kg. We are using BLDC motors extensively for both linear and rotary applications. Entrepreneurs

interested in using these motors can contact us for details.

B.S. Sastry and B. Ramana

Aerospace Engineers,
DRDO, Govt of India

The author Sanjay Banerjee replies: Your inputs are valuable, and it would be my pleasure if you share some more details of your work in this sector. Readers like you motivate us to dig deeper on a subject and write for the greater benefit of the society.

□ Your article 'Green Mobility' is very helpful for startups to understand the future of EVs as also the current scenario in Li-ion sector in India. Please also publish some article on government's policies and future plan for EVs.

Through email

The author Sanjay Banerjee replies: It is a pleasure knowing that you have gained from the article. Going forward, it would be our endeavour to write an articulated article on Indian government's policies for the sector. As I understand, India lags behind in the race of lithium reserves. Therefore it must look at other forms of energy to drive the Green Mobility vision. My next article in this issue focuses on how different organisations are gearing up to take advantage of Electric Vision - 2030 set forth.

MESSAGE DISPLAY

We are looking for a complete kit of LED-based moving message display.

Please provide the list of related projects published in EFY.

Kamal Kumar

Through email

EFY. You can refer to the following projects:

1. LED Scrolling Display (<http://electronicsforu.com/electronics-projects/hardware-diy/led-scrolling-display>)

2. Propeller Message Display with Temperature Indicator (<http://electronicsforu.com/electronics-projects/propeller-message-display-with-temperature-indicator>)

FINGERPRINT DOOR LOCK

In 'Fingerprint Door Unlock System Using Arduino' DIY article published in EFY Jan. 2016, can we use any other module if correct Rx pins are selected?

Sandeep Chakraborty

Through email

□ The code for this project shows the following error message:
"Fatal error: Adafruit_Fingerprint.h: no such directory
#include compilation terminated. Exit status 1. Error compiling for board Arduino/Genuino uno."

Please help.

Chris C.K.

Through email

The author Dinu D. replies to Sandeep Chakraborty:

This project will not work with other biometric modules because almost all the commands (99.9 per cent) for other sensors are different. To verify this, you can compare the datasheet of R305 sensor with other sensors'.

Reply to Chris:

This error in the code is because you didn't add the Fingerprint.h header file for R305 module. Please include library file in the Arduino folder and try again.
