

## AI could replace doctors and lawyers in five years

By 2022, smart machines and robots may replace highly trained professionals in tasks within medicine, law and IT—forecasts leading research and advisory company Gartner.

“The economics of artificial intelligence (AI) and machine learning will lead to many tasks performed by professionals today becoming low-cost utilities,” says Stephen Prentice, vice president and Gartner Fellow. “AI’s effects on different industries will force enterprises to adjust their business strategy. Many competitive, high-margin industries will become more like utilities as AI turns complex work into

a metered service that the enterprise pays for, like electricity.”

The effects of AI on an enterprise will depend on its industry, business, organisation and customers. Law and financial services are among the industries where jobs could be automated. However, while AI will hit employment in some industries, many others will benefit as automation of routine and repetitive tasks will leave more time for the existing workforce to improve service levels, handle more challenging aspects of the role and even ease stress levels in some high-pressure environments.

## On The Move

### Schneider Electric appoints Swaminathan as VP

Schneider Electric has appointed Venkatraman Swaminathan as the vice-president, IT Division - India Zone. Swaminathan takes over from Nikhil Pathak, who has moved to a new role as the vice president-strategy deployment and operations, ROW-IT Business at Schneider Electric. In his new role, Swaminathan will be responsible for driving the growth of the overall IT business in India. With over 26 years of experience in the field of sales, service and marketing, he brings a wealth of experience in the field, having evolved business-critical solutions for spaces like data centre switch rooms and test laboratories.

## OTT to surpass broadcast TV

Within the next five years, live-linear streaming over-the-top (OTT) video viewership will surpass traditional broadcast TV viewership, according to close to 70 per cent of respondents in the 2017 *OTT Video Services Study* by Level 3 Communications, *Streaming Media* and Unisphere Research. This annual survey on OTT trends was based on responses

from almost 500 media industry professionals.

“The maturation of OTT video delivery reflects key changes in the industry, including fewer bandwidth constraints and the important role live-event and live-linear OTT distribution will play as we transition from VOD-only services to those that more closely mimic traditional broad-

cast delivery,” said Tim Siglin, contributing editor for *Streaming Media* magazine and principal report author.

The report finds that the OTT industry is booming. About half of respondents anticipate OTT revenues to grow 30 to 50 per cent from 2016 to 2017. Over the next three years, OTT-related services will account for more than a quarter of their overall business, according to nearly two-thirds of respondents.

## New technologies drive double-digit growth in connected homes

The connected homes market will grow beyond \$150 billion, with revenues growing at 14.9 per cent in 2017. Technologies such as Internet of Things (IoT), Big Data, data analytics and the cloud are propelling double-digit growth and market expansion in connected homes and light-emitting diode (LED) lighting sectors—finds a

study by Frost & Sullivan.

Smart thermostats, Internet protocol cameras, smart door locks, IoT-enabled LED lighting and personalised mobile health services will see strong growth. Data analytics will penetrate beyond energy management, to equipment management, people management

and supply chain. The cloud’s full potential in energy management will be realised by developing a centralised data repository for customers to access their building’s energy data, while connected HVAC systems in the commercial segment will augment predictive maintenance and remote diagnostics capabilities.
