

Fig. 8: Actual-size PCB layout of the receiver

Fig. 9: Components layout for the PCB in Fig. 8

will last for  $150/8.68571 = 17$  days

Current consumption (receiver)  
is  $\{(10 \times 32) + (32 \times 8.0)\} / 42 =$   
13.714mA seconds  
 $= (13.714 \times 60 \times 60 \times 24) / 3600$   
 $= 329.143\text{mAh}$

On a 3.7-volt, 150mAh button cell, it will last for about  $150/329 = 27$  minutes.

Display consumes more current. Note that nRF24L01 radios operate off at maximum 3.6 volts. Sometimes, when the Li-ion battery is fully charged, the voltage may go as high as 4.01 volts, so the radio may not work. Put a diode in series with the battery connection so that

### EFY Note

the voltage drops by 0.7 volt and the radios start working again.

## Construction and testing

An actual-size PCB layout for the transmitter circuit is shown in Fig. 6 and its components layout in Fig. 7. PCB layout for the receiver circuit is shown in Fig. 8 and its components layout in Fig. 9. After assembling the circuits on respective PCBs, enclose these in suitable cabinets and place them some distance apart.

Connect the battery to the and measure the current withdrawn is transmitting for two seconds for the remaining periodicity, we used the ICU, which is not provides five increments, 50ms, 500ms, 2, 4 that means, it will require  $5 \times 8 + 2 = 42$  T22 sensor requires 5 volts to operate. A fairly big capacitor as its Vcc and GND will get temperature reading values as it takes two seconds

Somnath Bera is an avid user of open source software. Professionally, he is a thermal power expert and works as additional general manager at NTPC Ltd

## Robustel R2000 Cellular Router

**Rugged, Programmable,  
High Efficiency and Cost Effective**

### Key Features:

- Dual SIM Redundancy
- Supports 2G/3G/4G
- WAN - Static/PPPoE/DHCP Client
- VPN Tunnel - IPsec/OpenVPN/GRE
- WAN Port Supporting PD feature (802.3at compatible)
- Expansive WiFi Network, up to 300 Mbps with MIMO Antenna
- Advanced Remote Management with RobustLink
