

ARTIFICIAL INTELLIGENCE

Share Your Knowledge

If you are an expert in your field of electronics, why not share your knowledge with the world?

Electronics For You invites electronics professionals and industry experts to write articles on their area of expertise and interest from different perspectives

Some of the topics we want you to write about are:

- Photonics: Optics & Optoelectronics
- Automation
- Power Electronics
- Components
- Telecom

So if you have an interesting topic or original article to share, please let us know at efyeditorial@efy.in

We would love to hear your good ideas too!

electronics
FOR YOU

coming years. Let us explore some examples of AI that we are using in our day-to-day life.

Transportation. AI has already been granted a licence for driving cars on the roads of California, USA.

Routine work. Robots can do mundane work like run household errands, supervise routine accounting and reports compiling, manage vehicles and so on. And, now these are capable of creating art, too.

Marketing. Rocket Fuel, a marketing tool, uses analytical science for

intelligent personal assistants that use AI.

Business. Examples of AI tools used for businesses are:

1. Gluru helps systematise online documents and emails, and uses AI to get the latest actionable information.

2. x.ai lets AI synchronise schedules and acts as a personal scheduler.

3. CrystallKnows incorporates AI to help you understand the best way to communicate with others.

Developers. For developers, some AI tools are:

1. Vicarious helps build the next generation of AI algorithms.

2. Prediction.io has easy-to-employ, open templates for a selection of advanced AI workloads.

3. h2o.ai helps build smarter AI applications that are rapid and scalable.

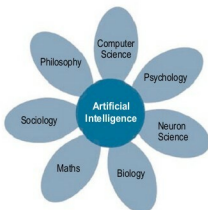

Fig. 2: Components of AI

adapting and scaling marketing return on investment by means of media and CRM channels. By considering diverse factors and data combinations, the engine bids on the required media and optimises campaigns.

AI tools

Companies like Google, Facebook and Amazon are investing a lot of money in their R&D divisions, and are buying startups that work in areas like machine learning, natural language and image processing.

A research at Stanford University has concluded that gradually more useful applications of AI, with thoughtful, positive impacts on our culture and economy, are expected to come out soon.

Let us take a look at some of the well-known AI tools.

Personal. Apple's Siri, Microsoft's Cortana and Google Now are

Limitations of AI

The main disadvantage of AI is the cost incurred in its protection and repair. All programs have to be efficient enough to suit the changing needs, and machines need to be made smarter.

Some of us have concerns regarding the application of AI, as they feel it is wrong to install AI into a machine so as to make it work for their benefit. Some of the reasons given by them are:

If robots start to substitute human beings in every field, it will ultimately lead to unemployment.

With so much help from machines, if human beings stop using their thinking abilities, these abilities will steadily decline. With AI, they may turn out to be overly dependent on machines, thereby losing their mental capabilities.

If control of the machines goes in wrong hands, it may cause a havoc.

Apart from these, there is the fear of robots overruling humans. Practically, we should be the masters of machines. But if things turn the other way round, clever machines could turn out to be smarter than us. **EFY**
