

Get Light of 18W LED Tube in Just 12W Only!

Now Switch To

4-foot T-8

ULTRA HIGH EFFICIENCY

PowerLED Tube Light

(Power Consumption 12W only; SAME light output)

ULTRA HIGH EFFICIENCY

33%

Lower Power Consuming

MOST EFFICIENT POWER RATING LED TUBE LIGHTS IN THE MARKET!

While most comparative competitive LED tubes achieve a lumen output of 1600 lumens at 18W approx., the **BINAY ULTRA HIGH EFFICIENCY QUADRA-12-ES PowerLED Tube Light** is designed for 2000 source lumens at a 33% lower power consumption of 12W, thus achieving considerable power savings (apart from much longer maintenance free life). The light output performance is equivalent to that of the 1200mm T-8 fluorescent tube.

5 YEARS Warranty WITH AN ESTIMATED LIFE OF 12-15 YEARS

Binay Opto Electronics Pvt. Ltd.

27, PANDITIA TERRACE, Calcutta 700 029, India

on-system EDA tools.

This might sound like the best alternative, but let us consider other alternatives before judging a tool.

Opening up the source

Open source E-CAD tools are becoming popular. With latest releases like Ki-CAD version 4.2, these have become more attractive than ever. With 3D rendering, Github library integration and support for making SPICE simulation, these are attracting designers big time.

Anuj Deshpande, founder, Makerville Solutions, says, "We can now make artistic circuits." He adds, "We can write scripts in Python and convert to a desirable format using Ki-CAD." Such features certainly make open source tools attractive. Let us look into some of these features that have cropped up in recent years.

On the designers' requirement, Neel Desai, product marketing manager, Lynx, strategic alliances and GTS marketing, Synopsys Inc., says, "Design managers need tools that can help them manage complex system-on-chip (SoC) design projects, monitor their progress and forecast their outcomes."

Cadence design team has come up with massively-parallel architecture, physically-aware context generation, unified global routing and PPA optimisation in their systems. This involves coordinating the design efforts of multiple engineers and analysing massive amounts of data, to achieve the fastest and most predictable tape-out possible. Some recent features are discussed next.

3D visualisation. Imagine making a circuit and being able to work on real-time problems, before having to face those problems in real time. Now, stop imagining and go for the latest tools and see for yourself. This option to visualise the full module before possibly destroying copper comes in very handy at times. "Parameters like heat dissipation can be calculated in 3D render itself," says Tamanna.

3D models also help in checking the final design of the device. With a simple 3D render, the design can be modified to suit various design requirements.

Power-distribution management. With the latest tools we can measure functioning parameters. This helps in checking if the design would work as expected or not. "If the board is getting heated in a particular area, then it has to be designed again," says Tamanna. This can also help in preventing disaster from striking at a later stage on copper.

Higher precision. With the reducing size of electronics on a daily basis, requirement for higher precision is also a concern. Earlier people were not concerned with a few millimetres. "But today, designers require very high precision," says Tamanna. Today, we
