then an FEM mesh created out of the geometry model. Load and support fixes are added to the model.

Finally, the material is added.

The designer prepares a framework or skeleton of the design. Then

he can use FEM to sort out problems like heat transfer, fluid flow or structural analysis. This is totally based on algebraic calculations.

Once the designer is sure of his designed product, he can give finishing touch to it. For example, in the case of a mechanical pulley system, once the freeware finds the design perfect as per calculations, the designer can define the places where the miscellaneous parts of pulley like nuts and bolts can be tightened.

Note. To read manual, please visit https://www.freecadweb.org/wiki/Manual#Key_features. For installation manual, refer

readme files. **EFY**
