

# Lock Your Design With ZenitPCB Suite

VERTICA ASTHANA

There are a lot many PCB design and simulation software available today. What if you get a software to make schematics, layouts and Gerber files free of cost? If the software is also easy to use with an easy user interface, it is definitely worth a try. Here we present such a software for electronics design, called ZenitPCB.

## Why ZenitPCB

ZenitPCB is a freeware comparable with other electronic design automation (EDA) software in terms of professional-level accuracy of designs. Users can import a mechanical drawing with a PCB and build their own board outline, thereby saving time while getting a concise layout. This can be done using 'Import DXF' command.

Users find this software easy to use even without any documentation. Still, for further assistance, there is a help window F1.

## Version 2.0 vs 1.8

**Verification and security.** From copy-and-paste of terminology to modifying the selected symbols or parts, ZenitPCB is now easily accessible for commands and functions. It takes just a double click to zoom around the component that is not verified. Coming to security part, users can lock the project even when the window is open. So accidentally or deliberately, no one can change the design.

**Pins attribute.** In pins attribute, users can insert pin names di-

rectly inside a grid, copy and paste, eliminating the tedious process of single, manual inputs. They can also change other attributes such as 'electrical type' and 'inside and outside edge.'

**Auto open part or symbol.** Users can directly open the part required for modification. The design output form is also redesigned.

**Trace the current in track.** 'Current capacity' helps to trace the
