

Industrial robotics

A new level of collaboration

The robotic revolution has already started – a new type of industrial robots, called collaborative robots or “cobots”, interacts directly and works alongside humans abandoning the need for safety cells. Due to our wide portfolio of power products and sensors, Infineon is able to address nearly every robot design regardless of its size, number of axes and payload. Discover our highly integrated solutions for industrial and collaborative robotics equipped with superior motor control, enabling the most compact and efficient drive designs in the industry.

Our benefits for you:

- › Size reduction of control box and drive units enabled by Infineon’s IPMs, IGBTs, MOSFETs and smart switches
- › Managing safety in collaborative and non-collaborative environments with Infineon’s torque, current, position and radar sensors
- › Multi-robot system usage – all topologies of robots can be addressed with Infineon’s wide range of switching solutions such as IGBTs, half bridges, MOSFETs and IPMs
- › Protecting brands and intellectual property of your robot design with Infineon’s OPTIGA™ security solutions

Explore our semiconductor portfolio to discover solutions that will take your industrial robotics and “cobot” designs into the future of manufacturing.
