Powering Automotives Globally

HAVE YOU EVER LOOKED AT THE WORLD FROM ABOVE? ONE THING THAT DEFINES ITS BEAUTY AND GRANDEUR IS THE MOVEMENT DOWN UNDER. THIS MOVEMENT, IN TECHNICAL TERMS, IS CALLED MOBILITY. WHAT OUR WORLD NEEDS TODAY IS GREEN MOBILITY

Trains, buses, taxis and trucks are always on the move, forming the networks that lead to the growth of cities and towns. Mobility and the supply chain are important to many businesses, to deliver goods and services. In fact, mobility has become the lifeline of human existence. Yet, it comes with its own hazards – living spaces can become noisy, congested, polluted and give rise to airborne viruses, which can impact human life for years to come. That's the reason why alternate forms of fuel, power and mobility drivers are now being explored. Research dollars are being spent in these fields to drive growth and create new business lines that will take the automotive sector into

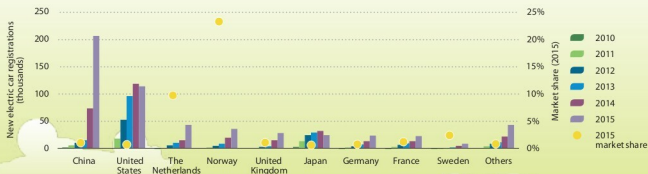

new realms. And one domain that is showing the maximum promise in terms of delivering sustainable transportation and mobility is electric vehicles (EVs).

Global trends in the EV segment

Growing business opportunities in green mobility, increased government understanding, reduced costs, higher demand and changing consumer habits are giving a fillip to the EV industry. As per industry trends and estimates, global EV sales are slated to touch 41 million by 2040 and constitute 35 per cent of new car sales. This could happen because of wider acceptance of the technology and allied industrial support.

Countries like China, USA, Japan, the Netherlands and France are currently the prominent markets for investments in EV. The growth drivers in these markets are: increased collaborative IP sharing, stakeholder interest, funding, advocacy for the technology, development of infrastructure to support EVs in terms of adequate charging facilities, and continuous investments in R&D. Government policies are being driven to adapt to these changes, which is encouraging. And it is expected that the global mass markets will follow the trends set by the early-adopter countries. Industry bodies and early adopters have succeeded in delivering practicality, sustainability, safety and

EV sales and market share in a selection of countries

The two main electric car markets are China and the United States. Seven other countries reached over one per cent EV market share in 2015 (Norway, the Netherlands, Sweden, Denmark, France, China and the United Kingdom).
