

done in three different ways. It can be fed directly via Python code, read from input files or preloaded into a constant or variable. The last comes of use for small data sets. Choose the method most suitable for your purpose.

Large-scale numerical computation made easy

TensorFlow offers powerful support for implementing and training deep neural networks, owing to its highly-efficient C++ backend. The support this software offers has acted as the foundation stone for many other developmental projects. DeepDream is an automated image-captioning software based on TensorFlow.

Another application is Rank-Brain, which was built to replace and supplement static algorithm based search query results. Rank-Brain is the brainchild of Google. Google also went on to build

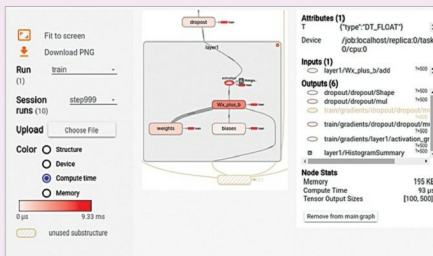

Fig. 3: Graphs and statistics on TensorFlow

Tensor Processing Unit, a custom application-specific integrated circuit for machine learning. The unit is a programmable accelerator for AI based projects and is tailored for TensorFlow. Google announced that they had been running these inside

their data centres for over a year and had achieved better results for machine learning applications. **EFY**
