SUGGESTIONS

I have been a regular subscriber to EFY since 1985. For the last few issues, I have noticed that DIY (do-it-yourself) projects published in EFY are mostly based on microcontrollers. Earlier, EFY used to have a Circuit Ideas section, which covered not so complicated circuits. But now this section has been discontinued. Please publish simple circuits for beginners as well.

I must say that EFY's printing quality is really good. I appreciate your great effort. Keep it up!

Happy Sison

Kerala

EFY. Thanks for the feedback! If you observe carefully, you will find that the content of DIY section is almost the same as before, except that we merged four separate sections (Construction Projects, Circuit Ideas, Software and Tips & Techniques.) into one Do-It-Yourself section. You will find simple circuits in every issue.

CRYSTAL TESTER

I have some doubts in 'Portable Crystal Tester' DIY article published in August 2016 issue:

1. Can I test the circuit on a breadboard in place of the PCB?
2. Where can I get the components?

Prakhyath N. Raj

Through e-mail

EFY. You can test the circuit on a breadboard. If you are in Delhi, you can get all the components from Lajpat Rai market. There are also many component vendors available online.

HOME AUTOMATION

I have assembled 'Home Automation Using Android' DIY project published in August 2016 issue and implemented

From electronicsforu.com

Electronics Projects

Where can I get MATLAB code of 'Image Compression Using Discrete Cosine Transform Technique' DIY project published in June issue?

Abdul Ahamad

EFY. You can download the code from the link: <http://www.efymag.com/admin/issuepdf/Imagecompressionusingdiscretecosinetransformtechnique.zip>

Thanks for publishing the 'Four-Channel Video and Audio Sequencer' project on your website (<https://electronicsforu.com/electronics-projects/four-channel-video-audio-sequencer>). I have learnt a lot.

I appreciate your efforts and the project. God bless you!

Samuel Wazala

In 'Motion Sensor for Security Light' circuit (<https://electronicsforu.com/electronics-projects/motion-sensor-for-security-light>), what is the main function of Zener diode?

Sangay Thinley

EFY. Zener diode regulates the voltage to 12V output.

I have assembled the 'USB MP3 Player' DIY project (<https://electronicsforu.com/electronics-projects/hardware-diy/usb-mp3-player>). After a few uses, the board started failing. Now whenever I connect a pen drive to the USB socket, the display of the board starts fluctuating and music stops playing. But when the pen drive is removed, the board functions normally with only the FM radio working. I have tested the pen drive in my computer and found it okay.

Anirvan Kule

The author Anirudh Kumar Sharma replies. This could be due to use of a low-current power supply or pen drive taking more current or wrongly formatted/corrupted pen drive. Try using a power supply that meets the power requirement. A 500mA supply will suffice. If the supply is common for the amplifier and the USB board, choose the size accordingly so that the USB board gets at least 500mA. Also please ensure that pen drive is formatted to FAT32 only.

it in my bedroom with light and fan. It's working really great. But how do I make manual connections as well?

Vinit Jangra

Through e-mail

EFY. Thanks for the feedback! You can make manual connections by skipping the relay either by shorting the relay contacts or near the AC mains connection point.

LED CUBE

In '4x4x4 LED Cube Using AT89C2051' DIY project published in October issue, on page 124, polarities of LEDs are wrong in the circuit diagram. Anodes and cathodes of all LEDs should be interchanged.

Veerabhadram Tumma and

Parveen Kumar

Through e-mail

EFY. Thanks for pointing out the mistake!

DRIP IRRIGATION

In 'Automatic Drip Irrigation System' DIY project published in October issue, the schematic has following mistakes: The relay used is rated at 12V. With this, the relay coil will never get sufficient voltage to operate the contacts from IC1. When pressed, reset switch S1 for IC1 will short-circuit 5V to ground.

Dr TK. Mani

Through e-mail

EFY. Thanks for pointing out the mistakes! Readers may please read the relay rating as 5V instead of 12V. Also, in the reset circuitry, pin 9 of IC1 is connected to +5V through resistor R3 (10-kilo-ohm). Only capacitor C3 is connected across S1.
