The Internet of Things (IoT) is slowly penetrating into traditional Indian businesses and is revolutionising the way they operate. Among IoT solution providers, Stellapps holds the distinction of disrupting the dairy farms business in India. Being the first-of-its-kind end-to-end dairy technology company, Stellapps provides Big Data, Cloud, mobility and data analytics solutions harnessing power of the IoT (Internet of Things) to solve challenges in the dairy industry. Challenges include unavailability of local expertise at affordable rates as well as productivity, quality, supply chain, animal insurance and farmer payment related problems.

Stellapps is working towards providing comprehensive farm optimisation and monitoring tools to dairy farms and cooperatives, making them more efficient. Its sophisticated solutions minimise hardware dependence and improve procurement processes.

From IT to dairy farming

Stellapps' five co-founders (Praveen Nale, Venkatesh Seshasayee, Ramakrishna Adukuri, Ravishankar Shiroor and Ranjith Mukundan) have known each other for more than a decade, since they worked for Wipro.

"Around 2010-11, wireless machine-to-machine (M2M)—more popular today as the IoT—was emerging as a disruptive technology. We figured out that it was the right time to use this technology to solve problems across verticals and that we could potentially build a global IoT platform. The dreams of building a 'Google of IoT' started taking shape in our heads," says Mukundan, CEO of Stellapps.

Despite having a large cattle population, India's milk yield is quite low compared to western countries'. On an average, an Indian cattle yields around four litres of milk per day, whereas cattle from the US, the UK and Israel yield up to 22 litres milk per day.

Solutions offered

Stellapps offers solutions to optimise milk production in farms and other collection centres through its products like BMC ConTrak and SmartAMCU. These solutions check the quality of the milk being produced and also help in storage optimisation. A part of the solution also helps to update dairy owners about the health of their cattle among other things.

SmartMoo BMC ConTrak. This state-of-the-art, microcontroller-based solution addresses advanced automation and control requirements of BMCs. The digital locking and improved tamperproof management system helps to ensure milk quality by preventing pilferage.

SmartMoo BMC ConTrak is powered by the cloud-based SmartMoo platform to enable preventive diagnostics and remote monitoring of various BMC parameters such as temperature, volume, cleaning-in-place events, efficiency, malfunctioning and potential misuse. SMS alerts are sent to various stakeholders. Daily/weekly/monthly reports
