

Smartwatch with traditional mechanical hands

Avoiding a smartwatch because you cannot do without the conventional hands of the clock? Well, MyKronoz's ZeTime is just the right choice for you. Claimed to be the world's first hybrid smartwatch with traditional hands and colour touchscreen, ZeTime has the best of both the worlds.

A special technology has been used to work a hole into the TFT touchscreen to fit the mechanical hands. At the same time, the watch has all the makings of a great smartwatch. ZeTime uses a tech called 'Smart Movement' that enables

the mechanical hands to function for up to 30 days on a single charge, allowing users to see the time even when the smartwatch screen is powered off. As a fully-functional smartwatch, ZeTime works for up to three days on a single charge.

ZeTime has a three-axis accelerometer and an optical heart-rate sensor to monitor heart-rate, steps, distance, calories, active minutes, sleep and so on. It also alerts users to get on their feet when they have been inactive for too long. Like other smartwatches, ZeTime lets users view incoming calls, read social networking notifications, get calendar reminders and more. The watch syncs to your phone using BLE, enabling you to check the weather, play music, take photos or locate your phone by making it ring. The watch

runs a proprietary operating system, while the app runs on Android 4.3+ or iOS 8.0.

You can pre-order the product on Indiegogo, where the project got funded over 10,668 per cent in April 2017!

Wearable, cloud-connected camera that uploads videos in real time

Want to film your party, but without missing all the fun and action? Need to document happenings at a protest rally, but can't do so openly? Well, Shonin's Streamcam wearable camera might be just what you need.

Streamcam is supposedly the world's first cloud-connected wearable security camera. It is cellular, rugged, waterproof, small and easy to use. Measuring just 56x56x13mm³, it can be clipped onto your dress, bag or vehicle. With just a single button-click, it captures wide-angle, high-resolution (720p) video with audio, which is immediately pushed to the cloud through cellular or Wi-Fi link, or broadcast to Facebook Live. The device also has an expandable Micro SD slot, pre-loaded with an 8GB card.

A discreet camera that instantly uploads recorded videos to the cloud (Courtesy: Shonin Inc.)

The camera has just a single button, which is used to start or stop recording. The app does everything else—such as turning the recording light on or off, and altering the resolution. You can view, edit and share videos quickly and easily. One of the thoughtful features by Shonin is that you can edit the video without losing the raw original footage, so you can go back and change or check stuff if needed.

This camera is just right for investigative journalists, who shoot videos to expose crimes, only to have the cameras grabbed and damaged by the goons before they get the chance to upload coverage. That risk is no longer there with Streamcam, which instantly uploads all recorded content to the cloud. You can pre-order the product now.

A smart night light that helps you move around and find stuff in the darkness (Courtesy: Team Zing)

Smart night lamp that stays alert when you are sleepy

When everything from the kettle to the shower is getting smart, how can night lamps be left out? The Zing Night Light is one such interesting and intelligent gadget that bundles a lot of smart technologies like object location and automatic path illumination. It works with iOS, Android, Alexa and Google Assistant, and is equipped with Bluetooth Smart and Wi-Fi connectivity, smart motion sensors, battery backup, event indicators and more.

Zing is made of energy-efficient LEDs that you can customise. It features automatic blue light reduction to help you sleep better. If you get up at night for a glass of water or to use the rest room, Zing detects the motion and gently powers its bottom LEDs up to 40 per cent intensity (configurable) to help you move around safely. After movement ceases, it returns to standby mode. When you connect multiple Zing lights together, these predict your path and automatically illuminate it. If the light senses any unusual or suspicious motion in the premises, it pushes notifications on your phone. Zing understands such behaviour by observing and learning your movement patterns over a course of 7-10 days.

Zing connects to your phone and acts as a visual indicator for incoming calls and other smartphone events. If you forget where you placed your phone, fitness tracker, smartwatch or other Bluetooth-enabled device, you can use Zing's Bluetooth object locator feature to find it.

Zing has an even wider scope as it is built with open technologies and can interface with many home automation platforms. The team will start shipping pre-orders internationally by year-end. The light comes with appropriate sockets for each region.
