

Fig. 7: Nerdcam 3D FPV camera

Also, it is very important to ensure that the FPV transmitter is compatible with the FPV receiver, monitor or goggles. Fortunately, today's 40-channel transmitters are compatible with almost all FPV receivers, monitors and goggles.

Antenna. The type of antenna used can make or break an FPV system. Although the antenna that comes with the transmitter/receiver will work well, you need to use a lightweight circularly polarised antenna to get a long range and clear reception. Else, go for the

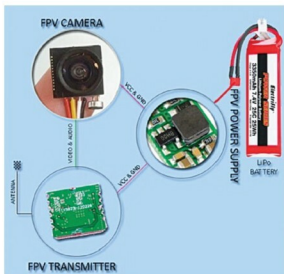

Fig. 8: FPV camera and transmitter setup (airborne)

type recommended by the radio module manufacturer.

Electric power. Typically, video transmitters and receivers operate off 3.3V to 5V/12V DC supply. Many FPV cameras also have the same operating voltage range. By using

components that operate at the same voltage level, it will be easier for you to wire the system straight to a suitable LiPo battery supply.

If the camera and other components need different voltages, or the airborne electrical system delivers a dissimilar voltage, it becomes necessary to use separate voltage regulator modules for each device. A wide variety of minuscule DC-DC step-up (boost) and step-down (buck) regulator mod-

ules are available for these purposes.

Once you learn to handle diverse components that make up a basic FPV, and build a functioning system with them, you are ready for your first ground test and maiden flight. Go, fly it! **EFY**
