Fig. 10: Image for quality factor of 10

Image information. File details including file name, data, size, format, height and width can be obtained using the command:

```
imfinfo('filename')
```

As an example, the command `imfinfo('Penguins_grey.jpg')` gives the following information:

```
ans =  
  
    Filename: [1x50 char]  
    FileModDate: '02-Aug-2016 09:24:12'  
    FileSize: 100978  
    Format: 'jpg'
```

```
FormatVersion: ''  
Width: 1024  
Height: 768  
BitDepth: 8  
ColorType: 'grayscale'  
FormatSignature: ''  
NumberOfSamples: 1  
CodingMethod: 'Huffman'  
CodingProcess: 'Sequential'  
Comment: {}
```

Information fields displayed by 'imfinfo' can be captured into a structural variable that can be used for subsequent computation.

The following example stores all the information into variable 'K':

```
K = imfinfo('Penguins_grey.jpg')
```

The information generated by 'imfinfo' is appended to the structure variable by means of fields, separated from 'K' by a dot. As an example, the image height and width are stored in structure fields `K.height` and `K.width`.
