

growth story. This will surely have a positive impact on India's macro-economic growth with the lowering of revenue outflows for expensive fossil fuels, giving energy to the country's Mission 2030 towards sustainable electric vehicle (EV) culture and, above all, creating an environment where every home can be lit up. Reduction in pollution and polluting agents would ensure a better, healthy life. On the social front, local employment possibilities would emerge and thereby reduce over-dependence on metropolis to create new jobs. We shall be seeing a lot of involvement from private and public enterprises, which will create newer, economically viable and growth-oriented Public-Private Partnership (PPP) Models.

To reap the benefits of RE, the government needs to set up infrastructure facilities, which, over a period, can replace or modify existing fossil-fuel-powered plants. Under the 12th five-year plan, estimates had suggested a trillion-dollar investment in energy grid requirements. With RE being a catalyst, the figure may go up even further. Therefore, financing RE would be a challenge. An experts group has been set up by the Niti Aayog to assess, utilise and enhance financing to achieve the first milestone of 175GW RE by 2022.

Renewable Energy Factfile

Over the last decade, renewable energy sector in India has seen an upsurge in the grid-connected power generation capacity. The essence of this change has been driven by the government's focus on sustainable growth in order to make the country energy-efficient within a specified time period. Solar enjoys the first-mover advantage with advanced technologies, innovations and skill training initiatives driving growth in this sector. Enlarging the scope of the National Solar Mission symbolises both, and indeed encapsulates the vision and ambition for the future. This transformational change is, perhaps, the highlight of the last five years of activities under the Mission. And the government is leaving no stone unturned with innovative solar solutions and parks, RE-investor global forums, major grid-connected rooftop solar programmes, earmarking of Rs 380 billion in Green Energy Corridor Projects (refer the map in Fig. 2). The first Green Energy Corridor Project is already underway to connect Raigarh in Chhattisgarh to Pugalur in Tamilnadu. It has been taken up by Power Grid Corporation (PGCIL) and is being commissioned by ABB Group in partnership with Bharat Heavy Electricals Ltd (BHEL) with layout cost in the range of Rs 43.5 billion. ABB's statement on this project reads: "This link is a key element of integrating RE with the main grid. It will integrate thermal and wind energy for transmission of power to high-consumption centres located thousands of kilometres away, supporting electricity demands in the south and transmitting clean energy to the north, when there is excess wind power."

In addition to the above initiatives and mechanisms,

DINRACK
INTEGRATED SYSTEMS PVT. LTD.

...A Shailesh Shinde Enterprise

Rely on us, we have:

- New Management team
- Brand New designs and products
- MNC Customer Base with International Projects
- All new facility with processes certified for ISO 9001:2015
