

Other than VoLTE and Vulkan, chipset manufacturers are also including MEMS and VoWiFi.

The process of developing a compact solution increases the time to market as efforts to integrate multiple functions in a single IC increases the time to design and develop. The more the time taken, the less would be the shelf-life of the component.

After 10nm fabrication technology, manufacturers are now targeting 7nm. GlobalFoundries plans to launch 7nm in three stages of lithography, namely, Gen1, Gen 2 and Gen3, which are likely to complete by 2020.

7nm technology is claimed to reduce power consumption by 60 per cent and improve performance by 40 per cent. But its practical implementation is a complex task, which requires refined design techniques. The time-taking process of chip fabrication usually leads to lowering of the SoC's shelf-life.

The SoC market was worth \$45.89 billion in the year 2016. It is expected to grow annually at a rate of 8.4 per cent from 2017 to 2025, reaching the size of \$89.03 billion.

The three leading SoC manufacturers together account for 68 per cent of the global market, with Qualcomm alone accounting for around 38 per cent.

Besides, India is believed to be the fastest growing market due to surge in electronics device sales, which have helped to propel technologies such as 3G, 4G and LTE. Experts predict a growth of 25 per cent during 2015-22. **EFY**
