

selected on the application. With successful interpretation, infrared (IR) signals are generated, which are then emitted through IR LEDs.

Adityanag Nagesh, co-founder, Sensara, adds, "The four LEDs installed on different sides of Sensy eliminate the need to place the unit in a straight line with the TV or STB in order to work. As long as you keep the remote within 4.6m (15-feet) distance from your device and there is no solid obstruction in between, the TV or STB can catch signals from Sensy irrespective of the position it is placed in the room."

The 16MHz crystal provides a clock to the microcontroller IC to coordinate actions of the circuit. The bulk capacitor avoids voltage drop when IR LEDs are fired with a high current during IR signal transmission. Bluetooth's low energy consumption enables the entire circuit to run on two AA-size batteries for a long time. The p-channel MOSFET in the battery path avoids circuit damage from wrong insertion of batteries. The circuit also supports on/off actions based on signals, allowing users to switch on or off their TVs and STBs using their smartphone.

What you can expect with Sensy

1. Control all major functions of your TV and STB (on/off, volume control, channel control, etc.)
2. Use your smartphone as a single consolidated remote for supported appliances (TV, STB and AC)—which reduces the possibility of damage or loss of a remote

The Sensy team (left to right): Anshul, Hormis, Aditya and Bharath

3. Long battery life with Bluetooth Low Energy
4. 360-degree infrared coverage
5. Device control from a distance of up to 12 metres (40 feet)
6. No need to remember channel numbers; you can view and

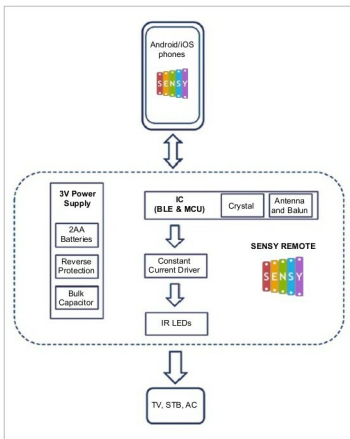

select channels and ongoing programmes from the mobile application

What's next

The Sensy mobile application is user-friendly with features like one-touch channel switching, voice control and search based on genre, actor, programme or language. Recently, it included support for air-conditioners also, which is currently in Beta phase. Going forward, the Sensy developers plan to add support for even more devices.

The biggest USP of the whole setup is that customers need not purchase or upgrade to a new hardware for compatibility with newer device additions. All the upgrades are managed through the software, so essentially the mobile application gets updated.

The Sensy Remote is priced at ₹ 1199, and can be purchased from Amazon's e-commerce site or the official Sensy website. **EFY**
