component sizes in the schematic. The enhanced footprint manager helps designers with updated component packages from EasyEDA library. It checks the component packages automatically and informs the user if the package is:

1. Correct as per the circuit design
2. Available in the EasyEDA library

If none of the above is true, Footprint Manager highlights the fault in red.

An additional feature of 'Zoom In' and 'Zoom Out' is also provided in the latest version, which helps designers to visualise components in 'Preview' area.

New 'Part List': This feature actively showcases different components in a list. So, designers can easily select a particular component. They can also get comprehensive details about the selected component. The package, value, tolerance and other description helps the designer to visualise the component and its features effectively. EasyEDA now also includes the feature to change the BOM expert location.

Addition of tools like 'Protractor': Designers would no longer be perplexed with angles as Protractor tool helps them to locate perfect angles at perfect locations.

Switching between the various open tabs. Without any struggle, users can now switch between the various open tabs while working on the software, which helps them to avoid any confusion and complexities.

An easy tool for designers

EasyEDA is a clever PCB design software with a vast updated library that helps to design cool schematics, simulate with SPICE and then import PCB files. The updated tools in EasyEDA version 4.8.5 save designers' time and energy. **EFY**

to sync the data to the server and get help to generate Gerber files required for PCB manufacturing.

Enhanced Footprint Manager. The schematic created by a designer is used to make the layout as well. Component footprints in the layout should be as per
