

Proview SCADA: The First Open Source SCADA Software

Proview SCADA is a powerful software for sequential control, supervision and data acquisition. Claimed to be the first open source SCADA software, it has been accepted globally. SSAB Oxelösund, the leading manufacturer of quenched and tempered steel, has the largest Proview installation. Ranging from raw materials to rolled plate, its entire production line is supervised and controlled by over 600 Proview systems.

Features

Proview SCADA is a distributed system in which several computers are interconnected via a network such as Ethernet. Programming in Proview is possible using graphical PLC editor or a high-level language like C, C++, JAVA or FORTRAN.

Other salient features of Proview SCADA include:

1. It is the only control system that can work in object oriented programs. Users can make the programming traditional and simple
2. The system is configured graphically, which helps to make the application simple, flexible and reliable
3. There are no limits to the number of inputs/outputs (I/Os), PLC programs, counters, loops, etc, and the PLC cycle loop is less than one millisecond
4. For connectivity, Proview SCADA supports different protocols, such as UDP or TCP sockets, via Ethernet and Siemens 3964R serially
5. As Proview operates on Linux and supports HLL, it is easier to implement on many I/O systems. It also supports Profinet, Ethernet

Powerlink, Modbus TCP, a few USB I/O cards, etc

Version 5.5.0 vs Version 5.4.0

Proview's latest version, 5.5.0 has some additional features as compared to the previous 5.4.0 version. Horizontal and vertical marker in

XY curve, table curve component, polynomial curve component, Xit translations and redundancy are amongst the upgrades. Besides, new classes have been added.

Horizontal and vertical marker in XY curve. Two horizontal marked lines are added in the graph, which
