In-circuit debugger

Microchip Technology has introduced an in-circuit programming and debugging development tool for its PIC microcontroller and dsPIC digital signal controller

products. MPLAB ICD 4 includes all the features of the popular MPLAB ICD 3 debugger while adding increased

speed through a faster processor and increased RAM. Its significant improvement in speed is accomplished through a 32-bit MCU running at 300MHz. Faster processing, along with an increased buffer memory of 2MB, makes it up to twice as fast as its predecessor.

Compute and acceleration platform

Artesyn Embedded Technologies has announced a compact compute and acceleration platform for applications ranging from small cell

baseband processing, scalable video streaming/encoding, video surveillance and 'bump-in-the-wire' monitoring to industrial computing. The MaxCore Micro is a cost-effective, enterprise-class chassis that holds a host server card and contains an additional slot for any PCI Express add-in card. While it can be used standalone as a complete system, its form factor allows three chassis to be fitted side-

by-side in a 48cm (19-inch) rack. A power budget of 150 watts per slot makes it possible to build a system with as many as 48 Intel Xeon D cores per compact chassis, using two dual-processor 12-core add-in cards.

RFI/EMI filter

Elcom International has introduced an AC three-phase four-wire RFI/EMI filter under EP355 Screw Series. This filter is available for current

rating starting from 3A to 250A. For models with current rating 3A to 40A, inbuilt surge

suppressor are also available. Filters with current rating 3A to 40A are mostly required for office equipment, medical equipment, general-purpose four-wire filtering and applications with tight space conditions. Input and output connections are done by screw lead type M4 terminals. Filters with 50A to 250A current rating can be used for general-purpose four-wire filtering, mainframe computer systems, UPS, high-power office equipment and installations comprising automation equipment.

8-in-1 robot kit

Dolphin Labs has developed a do-it-yourself robotics kit that contains all the necessary material required for building eight different types of robots

like black line follower, white line follower, edge follower, object avoidance, object follower, touch me not, photo maniac and photo phobic. The robots are battery operated and don't require soldering and programming. The kit can be upgraded for programming using microcontroller boards. Also, all parts can be separated and reused.

Programmable DC motor controller

Roboteq, Inc has introduced an intelligent controller capable of directly driving three DC motors up to 60V and 60A per channel. The FDC3260 can be used for mobile robots and automatic guided vehicles. The three high-power outputs are particularly effective for XYZ stabilization platforms, flight simulators or driving three thrusters in underwater robot applications.

The controller accepts commands, and can switch automatically from analogue joystick, standard R/C radio, USB or RS232 interface. Using the USB or serial port, it can be used to design fully or semi-autonomous robots by connecting it to single-board computers, wireless modems or WiFi adaptors.

The FDC3260 incorporates a Basic Language Interpreter capable of executing over 50,000 Basic instructions per second.
