

Fig. 25: SDAccel environment

improve acceleration capabilities by offering ten times higher memory bandwidth relative to discrete memory channels. HBM technology enables multi-terabit memory bandwidth integrated in a package for the lowest latency.

Vineyard employs widely used data analytics frameworks such as

Spark that make it easier for cloud users to access accelerators.

IBM's SuperVessel cloud platform, built on top of Power/OpenPower architecture technologies, provides remote access to all the ecosystem developers. Built on OpenStack, the cloud enables:

1. Latest infrastructure-as-service

es, including PowerKVM, containers and docker services, with big endian and little endian options

2. Big data service through collaboration with IBM big data technology for Hadoop 1.0 and open source technology for Hadoop 2.0 (Spark service)

3. Internet-of-Things application platform service which has successfully incubated several projects in healthcare, smart city, etc

4. Accelerator-as-service (FPGA virtualisation) with the novel marketplace, through collaboration with Altera

In SuperVessel platform, FPGAs and GPUs provide acceleration services, while OpenStack manages the whole cloud.

Programming

OpenCL flow allows code written in the increasingly popular parallel-friendly GPU-inspired C dialect to be targeted to Altera FPGAs. Xilinx,
