

Team LeChal

service. It connects to the Bluetooth-linked pods and relays data to generate haptic sensations.

The pods feed the navigation data in real time as the user starts travelling, and send signals in the form of various vibratory patterns to indicate directions of travel. For example, gentle vibrations on the left leg imply left turn and vibrations on the right leg imply right turn. Vibration patterns can be customised as per the convenience of the user.

Most importantly, maps can be downloaded and saved to the phone or tablet before use and the connection is Bluetooth driven (as mentioned before), so there is no

problem of poor network connectivity or data unavailability.

Expanding horizons

Initially aimed for the visually challenged, LeChal is finding other consumers as well. Lawrence states, "At this point, along with the visually challenged, our product has proven to be appealing to people who travel a lot. Fitness enthusiasts also show a keen interest in the product because of the extremely accurate measurement of fitness metrics. Last but not the least, we have managed to captivate the imagination of technophiles as well."

The product has caught the eyes of enterprises also, collaborating
