

AggreGate SCADA: An Open Source IoT Platform

In this era of the Internet of Things (IoT), an open source data acquisition and high-level supervisory management SCADA system packaged with IoT is a win-win solution for designers. AggreGate SCADA is such an IoT platform that employs networking technology of reigning industry standards.

Features of AggreGate SCADA

The IoT and automation are used for centralised data collection and human-machine interface (HMI) handling. HMIs can be launched on Linux, Windows PC and web browsers, making AggreGate SCADA a user-friendly open source freeware.

In addition, AggreGate SCADA comes with a bunch of drivers meant for data-collection and HMI vector images. It has a large automation and control symbol library, where symbols are listed in SVG format.

AggreGate SCADA has all the tools for production, process control and planning that can be customised to the users' requirements. The tools include models, expressions, queries and classes. These are used to calculate metrics, define KPI formulae for process control, execute SQLs like requests and maintain the large production data, respectively.

Thus, manufacturing and equipment tracking is possible with AggreGate SCADA. It is a smart SCADA system that not only provides data acquisition for manufacturing processes but also helps in IT infrastructure management.

Boon for production/process engineers

Designers not only get the benefit of controlling, monitoring and configuring different electronic devices but also accumulating the data in the cloud, which can be accessible to all users.

As discussed earlier, AggreGate SCADA is an IoT based platform and thus it has all the features required in a fourth-generation SCADA. It

can run on any embedded system as the system operates on Linux and is based on Java platform.

It is a boon to manufacturers for process control, telemetry, test and measurement, and, above all, the Industrial IoT (IIoT) and home automation. It can prove to be a backbone for remote monitoring of devices and networking of systems.

Be it IoT application to sensor network service or physical access control to building automation, and
