GPS monitoring to digital signage, AggreGate SCADA is on its way to create a legacy.

Applications

AggreGate SCADA has a variety of features including monitoring of servers, applications, VoIP, charting, advanced alert system and

plugin SDK.

In power engineering, as transmission and distribution get complicated due to increasing demand for power, there is a dire need for system control and remote monitoring, analysis, real-time visualisation, supervision of power generation and many more features. Aggre-

Gate SCADA is thus a boon to the growing smart grid industry and its demands.

Smart city is a dream project for many countries where the manual system is converted into automated system. Surveillance and security systems and efficient transportation are the areas where AggreGate SCADA is finding wide usage. It is also being used for wastewater management systems. Thus, AggreGate SCADA is finding use in diverse fields.

To conclude

AggreGate SCADA provides a wider perspective to designers and manufacturers in all the environments. Thus, fields ranging from petrochemical to agriculture, government, IT infrastructure management, power engineering, mining, centralised cooling management systems, nuclear reactors and telecom are all using AggreGate SCADA. **EFY**
