and sent by the clients appropriately, sending reply to all. It has SDK support for Java API on Linux platform.

Client controller perspective.

The client controller tool of IoTivity simulates the functionality of OCF client. It helps the user to find interested types in the given network so that resources can be changed. It also supports sending of automatic requests (GET/PUT/POST) to remote resources with the help of RAML file. The simulator helps the user to test the implementation by simulating real devices before purchasing them.

To wrap up

Features like cross-platform support, uniform and easy-to-use APIs, open standards, support for multiple connectivity types and extensible support protocols make IoTivity a hard-to-resist tool. It provides seamless device-to-device connection throughout physical media, application layers and transports. **EFY**
