

► These machines work wirelessly with minimal hardware setup, saving you space and setup costs

Businesses are going flexible with the upheaval of cashless transactions. Demonetisation has further expanded this transition, driving a great surge in the usage of swipe machines and e-wallets. Smart point-of-sale (POS) or mobile POS (mPOS) machines are retailers' best friends in light of the recent events. Here are a few reasons why enterprises are using smart POS devices to manage their transactions.

Flexible for any business

Traditional POS devices involve a lot of hardware installation and maintenance hassles. Setting up a

computer, connecting the devices and upgrading the software is not only time- and space-consuming but also requires external technical service. Enterprises also need to invest in training the staff to handle the cash counter. In nutshell, online enterprises and businesses without a proper payment collection station cannot afford a POS system.

That's where mPOS machines provide a big advantage. These give the cash counters a chance to work wirelessly with minimal hardware setup (a small card reader hardware, a smartphone and a GPRS or Wi-Fi connection). This also implies less

cost in terms of space requirement, setup and external help. Smart POS machines are user-friendly, requiring little to no effort in getting the assigned person started with the technology. So if you move your office to a new location, you do not have to worry about holding off your POS services until the setup and installation completes. Smart POS machines can work anywhere at any time as long as network connectivity is available—be it through Wi-Fi or GSM (via SIM card). That means mPOS devices can be incorporated in any form of business.
