

SOLAR PUMP FOR INDUCTION MOTOR & BLDC

BOM of 10HP solar pump control unit less than Rs. 7000

- * Design can be used for normal three phase induction motor and BLDC, same PCB different software.
- * Tracking efficiency > 99.95%
- * Latest design released in 2020 with reduced material cost and further simplified PCB with discrete IGBT and F-type heatsink. No need to use expensive IGBT module
- * Suitable for standard 415V/ 240V / 110V 3-Phase 0.25HP to 10HP pump
- * Panel input voltage from 150V to 850V
- * For BLDC application MOSFET can be used which further reduces the cost
- * AC output voltage: 0 to 480V phase to phase, 0 to 65Hz.
- * Input and output current limiting with DC-CT and AC-CT so more reliability
- * With boost and without boost operation possible
- * Protection from short circuit, overload, excess panel current / wattage, excess motor current, high temperature.
- * MPPT VF drive will give constant torque even at varying sunlight resulting in more water output
- * The system runs at maximum efficiency all the time by constantly maintaining the motor in the right slip.
- * Separate control port for atta chakki, chaff cutter and deep freezer / cold storage
- * Wireless connectivity through GPRS / Wifi : Internet uploading and online monitoring of panel voltage, current, power, energy produced

Technical know-how transfer cost is Rs. 12 lakhs

“IoT Is NOT A BUZZWORD Anymore”

To understand this report better and how its findings can benefit you, we spoke to Satyajit Sinha, senior analyst at IoT Analytics. Here are some excerpts of our discussion

How did you manage to classify/quantify data for elements like MCUs that can be deployed for other than IoT applications too? Is this study based on data collected directly from the OEMs, their distributors, or other secondary sources?

We have done detailed research on the top eight MCU vendors and bottoms-up analysis of their product portfolio. We excluded the MCUs for smartphones and other non-IoT products and aligned their segregated revenue as per IoT Analytics' definition of IoT.

The research is based on a rigorous process with academic and industry-recognised methodologies (such as web-based analytics, trends analysis, and publicly available data on the market—such as annual reports, company websites, public M&As, and interviews of EDA, IP, connectivity chipset, and security players). The insights gained through these methodologies were enhanced by IoT expertise from internal
