

Flexibility to Innovate in Your Designs

eXtreme Low-Power MCUs with Smart Performance

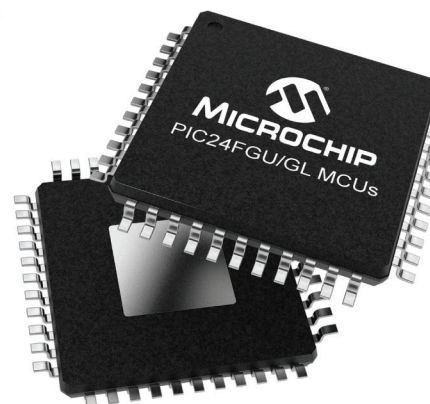

The PIC24F 'GU/GL' family of eXtreme Low Power (XLP) microcontrollers (MCUs) enables the development of an array of innovative applications, both with and without displays. Packed with many Core Independent Peripherals (CIPs) that can function in power-saving modes, the PIC24F 'GU/GL' MCUs offer ultra-low power operation for battery-powered and other power-conscious designs.

To secure your designs, the PIC24F 'GU/GL' MCUs include code protection features and work with our CryptoAuthentication™ devices to simplify adding security to your cloud-connected IoT application. Capable of operating in a harsh environment, these MCUs operate up to 125°C and include a range of hardware safety features, making them ideal for automotive, industrial and consumer applications.

Supported in MPLAB® Code Configurator (MCC), a free and easy-to-use graphical programming environment, these MCUs support application libraries like Bootloader, IoT sensor and others to simplify your designs.
