

Can We Do Better Than Tesla In India?

India—a part of Indo-Pacific and the second most populous country in the world—is forecast to undergo a massive change in the adoption of EVs soon

Mukul Yudhveer Singh

Electric vehicles (EVs) have taken the world by storm. These are being adopted more and more in different parts of the world. The global EV market, valued at around \$162.34 billion in 2019, is forecast to be worth \$802.81 billion by 2027, and a report by Allied Market Research points towards Indo-Pacific as the highest revenue contributor.

If a report by Avendus Capital is to be believed, the opportunity encompassing EV market in India will be around 500 billion rupees by 2025. With this mind-boggling figure, growth of companies like Tesla, and the government of India's keenness to make EVs popular here, we try to answer here a simple question: Can India develop an EV company better, or at least as good as Tesla?

"When we talk about recreating the Tesla story, it is not about how we create a fancy car company, it is actually about how we recreate the success story of what Tesla has been able to give to the entire world. It is not about how cool the product looks, or how good it performs, but about building the entire ecosystem for creating EVs," says Kislaj Pankaj, CTO, Micelio.

In the years 2019 and 2020, about 100,000 to 150,000 EVs were sold in India. This is less than one per cent of the total number of vehicles that were sold during that time. The EV ecosystem in India is dominated by startups, and investments in Indian EV startups by corporate, venture capital and private equity firms have seen a
